DIRECTORATE-GENERAL FOR ECONOMIC AND FINANCIAL AFFAIRS

PRICE AND COST COMPETITIVENESS

4th quarter 1994

**PART 1: QUARTERLY REPORT
PART 2: TABLES AND CHARTS**

COMPETITIVENESS AMONGST INDUSTRIALISED COUNTRIES

QUARTERLY REPORT - FOURTH QUARTER 1994

This report provides a periodic assessment of the macroeconomic competitiveness of the European Union (EU) and 20 industrialised economies on the basis of a number of cost and price indicators. It appears quarterly. It consists of two parts. *Part 1* offers an analysis of recent developments. The discussion is illustrated by a small number of tables and graphs. *Part 2* provides more detailed information. For each country, changes in nominal and real effective exchange rates are presented in the form of tables and graphs.

The **nominal effective exchange rate (NEER)** aims to track changes in the value of a nation's currency relative to the currencies of its principal trading partners. It is calculated as a weighted average of the bilateral exchange rates with those currencies.

The **real effective exchange rate (REER)** aims to assess a nation's competitiveness relative to its principal competitors in international markets. It corresponds to the NEER deflated by selected relative (or 'effective') cost or price deflators. *Part 2* of the report presents real rates based on the GDP deflator, the deflator of export prices, the deflator of producer prices in manufacturing, unit labour costs (ULC) in manufacturing as well as unit labour costs in the economy as a whole.¹ The discussion in *Part 1* focuses on rates based on the latter two deflators.

The current report presents in *Part 2* competitiveness indicators for both EU12 and EU15. In future reports the indicators for EU12 will no longer be provided. Instead, indicators pertaining to the group of countries participating in the Exchange Rate Mechanism will be included. The focus in *Part 1* is on EU15.

1987, the year of the Louvre Accord and the last realignment of the 1980s, is taken as the base period for the various indices calculated. This does not imply that 1987 exchange rates should be treated as equilibrium rates.

Part 1 of the report starts with summary of main developments since 1987. It consists of two sections. The *first section* presents exchange rate developments of the US dollar, the Japanese yen and a basket of EU currencies relative to twenty industrialised nations. In this first section the bilateral position of the European Union relative to the United States and Japan is also examined. The *second section* comments on exchange rate developments among the countries of the Union, including the new Member States: Austria (A), Finland (SF) and Sweden (S).

¹ A technical annex provides further details.

PART 1

**COMPETITIVENESS
AMONGST INDUSTRIALIZED
COUNTRIES**

QUARTERLY REPORT

4TH QUARTER 1994

EVOLUTION OF THE MACROECONOMIC COMPETITIVENESS OF THE EUROPEAN UNION

MAIN CONCLUSIONS

In the fourth quarter of 1994:

- The competitive position of the Union weakened. The European currencies continued to appreciate relative to the US dollar and the Japanese yen. The rate of appreciation relative to the US dollar, however, slowed down significantly (to 1% in both nominal and real terms), as the Union's unit labour costs started to decline relative to those in the United States. European unit labour costs continued to rise more rapidly than the Japanese, which contributed to the 2% loss in the Union's competitiveness relative to Japan.
- The currencies participating in the ERM stabilised in nominal terms and most of them recorded small gains in cost competitiveness. The nominal appreciation of the Finnish, the Swedish and the British currencies led to losses in cost competitiveness that varied between 2% (UK) and 5% (Finland). The 1% loss in competitiveness of the Greek manufacturing sector was due to rising unit labour costs. The depreciation of the lira improved Italy's competitive position by 2%.

Since the first quarter of 1994:

- The European currencies have started to appreciate after 1½ year of decline associated with the crises in the EMS. Their real effective exchange rates have risen by 8% relative to the US dollar and have stabilised relative to the Japanese yen. Overall, the competitive position of the EU has deteriorated by 3% relative to its industrial partners.
- The larger Union Member States have made small gains in cost competitiveness. The largest losses occurred in smaller countries on the Union's periphery: Greece, Portugal and Finland. In Greece and Portugal, the losses in cost competitiveness were caused primarily by rising unit labour costs, but in Finland the appreciation of the markka was the sole culprit.

Since the first EMS crisis (since the third quarter of 1992):

- The European currencies have depreciated by 18%, which has led to a 16% improvement in European cost competitiveness. The negative effects of rising relative unit labour costs have been limited to 2%. The position of the European manufacturing relative to its Japanese competitors has improved by 27%. Relative to the US a gain of 12% has been achieved.
- The core currencies of the ERM have appreciated by between 4 and 11% in nominal and real terms. The competitive position of Spain, Ireland, Italy, Finland and Sweden, on the other hand, has improved significantly. The Irish and Finnish gains were mainly due to important reductions in relative unit labour costs. In the other three countries, the nominal depreciation of their currencies was the dominant factor.

Over a longer perspective (since the first quarter of 1987):

- The European Union's competitive position remains unchanged, despite the 9% nominal depreciation of the European currencies. A 19% deterioration in cost competitiveness relative to the United States has offset improvements relative to Japan (13%) and other countries.
- The almost continuous rise in European export prices (expressed in national currency) has led to steady increases in the profitability of the Union's economy. The Japanese economy, on the other hand, has suffered from an almost continuous decline in export prices and profitability which can be linked to the yen appreciation. US export profitability has declined by 2% in spite of a 5% rise in export prices.

COMPETITIVENESS AMONGST INDUSTRIALISED COUNTRIES

QUARTERLY REPORT - FOURTH QUARTER 1994

L. INTERNATIONAL DEVELOPMENTS

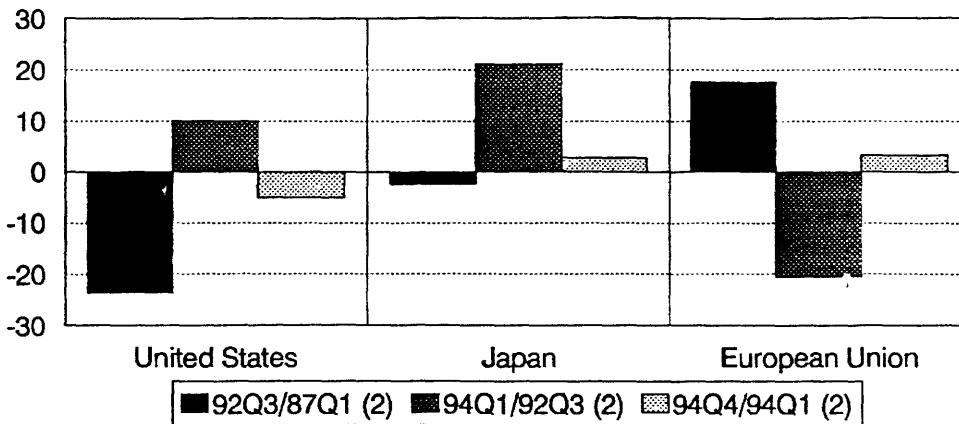

The development of the macroeconomic competitiveness of the industrialised countries since the Louvre Accord can best be described by distinguishing three periods (see Graph 1).

The first period runs from the first quarter of 1987 to the third quarter of 1992. During this period, which came to an end with the first crisis in the EMS in September 1992, the US made great strides in improving its competitive position. The nominal depreciation of the dollar and a decline in unit labour costs both contributed. The European Union lost on both accounts: currency appreciation and a rise in relative unit labour costs contributed to a 19% loss in cost competitiveness. A significant rise in productivity in the Japanese manufacturing sector more than offset the negative effects of the nominal appreciation of the yen.

The second period runs from the third quarter of 1992 to the beginning of 1994. The EMS crises caused a nominal and real depreciation of the European currencies (19%). The yen, on the other hand, started to soar leading to a 24% loss in Japanese competitiveness. American cost competitiveness declined by 11% as the dollar appreciated relative to European currencies and the Canadian dollar. The depreciation of the dollar relative to the Japanese yen is a constant feature of all three periods.

The third and final period starts with the first quarter of 1994. Graph 3 illustrates renewed gains in US competitiveness and corresponding losses for the European Union and Japan. In Europe, the EMS crises have been overcome and the European currencies have started to regain some of the ground lost in the previous period. The ensuing losses in EU cost competitiveness, however, are of lesser concern than those of the first period because relative unit labour costs have finally stabilised. The defining characteristic of the third period is the fear that economic recovery will release inflationary pressures, especially in the United States. This fear has contributed to the weakness of the dollar and the associated gains in American cost competitiveness. However, the fears of an increase in US inflation have not (yet) been realised and in November 1994 the decline of the US dollar came to a halt.

GRAPH 1
DEVELOPMENT OF COST COMPETITIVENESS (1)
RELATIVE TO INDUSTRIAL PARTNERS
SINCE THE LOUVRE ACCORD

(1) Cost competitiveness as measured by the nominal effective exchange rate deflated by unit labour costs in MANUFACTURING.
A minus means an improvement in cost competitiveness.
(2) Expressed as the natural logarithm of the ratio (in %)

1. United States

In the fourth quarter of 1994, the rate of dollar depreciation (which had reached 4% in the previous quarter) slowed down to less than 1 per cent in nominal terms (see Table 1)¹. In October the dollar continued to depreciate rapidly, reaching a two-year low of 1.49 Deutsche Mark per US dollar and a post-war low of 96.1 yen per dollar by the end of the month². In November, however, the combined effects of a decisive tightening of US monetary policy, the Republican victory in US mid-term elections and well-timed interventions by the Fed and the Bank of Japan in foreign exchange markets amounted to a steady recovery of the dollar. In December, international currency markets were relatively stable³.

¹ The exchange rates considered are averages of daily exchange rates.

² The DM/\$ rate decreased from an average of 1.562 in the third quarter of 1994 to 1.544 Deutsche Mark per US dollar in the fourth quarter. The ¥/\$ rate also declined: the third quarter average of 99.1 yen per dollar dropped to 98.9 yen per dollar in the fourth quarter.

³ The latest exchange rates available are: 1\$=1.536 DM (10.1.1995) and 1\$=100.25¥ (10.1.1995).

TABLE 1: MACROECONOMIC COMPETITIVENESS OF THE UNITED STATES, JAPAN AND THE EUROPEAN UNION RELATIVE TO TWENTY INDUSTRIAL COUNTRIES

A. EVOLUTION IN MANUFACTURING INDUSTRY									
% Change	During fourth quarter 1994 (94 Q4 / 94 Q3)			Since the first EMS crisis (94 Q4 / 92 Q3)			Since the Louvre Agreement (94 Q4 / 87 Q1)		
	NEER (1)	ULC (2)	REER (3)	NEER (1)	ULC (2)	REER (3)	NEER (1)	ULC (2)	REER (3)
USA	-0.8	0.8	-0.1	3.5	1.5	5.0	-13.9	-3.7	-17.0
Japan	-0.5	-0.9	-1.3	34.2	-5.4	27.0	49.1	-16.8	24.1
EU15	0.8	-0.1	0.7	-17.6	1.9	-16.0	-9.0	10.3	0.3

B. EVOLUTION IN WHOLE ECONOMY									
% Change	During fourth quarter 1994 (94 Q4 / 94 Q3)			Since the first EMS crisis (94 Q4 / 92 Q3)			Since the Louvre Agreement (94 Q4 / 87 Q1)		
	NEER (1)	ULC (2)	REER (3)	NEER (1)	ULC (2)	REER (3)	NEER (1)	ULC (2)	REER (3)
USA	-0.8	0.7	-0.2	3.5	4.1	7.7	-13.9	7.1	-7.7
Japan	-0.5	-0.4	-0.8	34.2	-3.6	29.3	49.1	-16.5	24.6
EU15	0.8	-0.1	0.7	-17.6	0.2	-17.4	-9.0	4.6	-4.9

Source : DG II.D.4 EC

(1) NEER = Nominal Effective Exchange Rate. A minus means a depreciation of the NEER.

(2) ULC = Relative Unit Labour Costs (in national currency).

(3) REER = Real Effective Exchange Rate = relative unit labour costs (in common currency).

A minus means an improvement in cost competitiveness.

The increasing inflationary pressures in the US are reflected in its slowly deteriorating relative cost performance (both in the manufacturing sector and the economy as a whole). **The beneficial effects of the 1% nominal depreciation of the dollar cancelled out against the 1% rise in relative unit labour cost.**

The rise in relative unit labour costs is also the principal cause of the decline in export profitability of the US economy as a whole (see Table 2)⁴, which has become much more evident recently. **Since the first EMS crisis in the third quarter of 1992, the US export profitability has declined by almost 6%.**

⁴ The relative export profitability of an economy is defined as the ratio of the relative export price index and relative unit labour costs in the economy as a whole (expressed in national currencies). It is an indicator of relative profit margins for producers of export goods and services in the various industrial countries.

**TABLE 2: EXPORT PROFITABILITY OF THE UNITED STATES, JAPAN AND THE EUROPEAN UNION
RELATIVE TO TWENTY INDUSTRIAL COUNTRIES**

(1) Relative price index of exports of goods and services (in national currency).
(2) ULC: Relative unit labour costs (in national currency).
(3) Relative export profitability.
A plus means an increase in relative profit margins for producers of export goods and services.

The cost performance of the US manufacturing sector has traditionally been better than that of the American economy as a whole. Still, the 1½% deterioration in cost performance of the US manufacturing industry was an important contributory factor to the **5% decline in cost competitiveness** since the first EMS crisis (see Table 1).

The long-term trend has been for the US to notch up significant gains in cost competitiveness by a depreciating dollar and reductions in relative unit labour costs in manufacturing, especially. Since the Louvre Agreement of the first quarter of 1987, the dollar has depreciated by 14% and US unit labour costs in manufacturing have decreased by 4% relative to those in other industrial countries. Relative unit labour costs in the economy as a whole, however, have risen by 7%. As a result, the cost competitiveness of the US manufacturing industry has improved by no less than 17% but that of the US economy as whole by a more modest 8%.

In spite of these gains in cost competitiveness, the relative export profitability of the US economy has declined by 2% (see Table 2). The room for manoeuvre offered by the 14% nominal depreciation of the US dollar has not been used to raise export prices. Consequently, the 7% increase in unit labour costs has resulted in a drop in export profitability.

2. Japan

In the fourth quarter of 1994, the appreciation of the yen came to a halt (see Graph 3). The nominal effective exchange rate of the yen declined by ½% (see Table 1). A small appreciation relative to the dollar was more than offset by the yen's depreciation relative to the Deutsche Mark⁵ and the European currencies in general (see Table 3). The partial trade agreement concluded in early October between the US and Japan reflected a changed attitude of the US government towards the Japanese trade surplus. This development and new data pointing towards a stabilisation of the surplus contributed to the perception that the yen would not go any higher. In this environment, the interventions by the Bank of Japan could finally succeed.

The end of the period of yen appreciation and the return of calm on currency markets should be welcome news to Japanese exporters which have been struggling to adjust to the strong yen. **The cost competitiveness of the Japanese manufacturing industry improved by 1% in the final quarter of 1994 (see Table 1).** The reduction in export prices, however, continued to have a negative effect on the profitability of the Japanese export sector (see Table 2).

Since the third quarter of 1992, export prices have come down by more than 10%. Around two thirds of the 34% appreciation of the yen has been passed through to foreign markets. Still, Japanese export profitability has declined by 7%, even if economy-wide unit labour costs have been reduced by 4%.

In a period of a little more than two years, the yen has appreciated by 34% in nominal terms. The quarterly rate of appreciation peaked at 9% in the second quarter of 1993. It is only because of the continued reductions in relative unit labour costs that the Japanese manufacturing industry has been able to reduce its losses in cost competitiveness to 27% (see Table 1).

Covering all of the period since the Louvre agreement, the cost competitiveness of the manufacturing sector has deteriorated by 24%, even less than the percentage given for the period since the first EMS crisis. **This implies that all Japanese losses in competitiveness have occurred since the EMS crisis and none in the period before.** Graph 1 illustrates this clearly. In the period between the Louvre agreement and the first EMS crisis the already significant appreciation of the yen was more than compensated by a reduction in relative manufacturing unit labour costs.

⁵ The ¥/DM rate rose from 63.45 in the third quarter of 1994 to 64.05 yen per Deutsche Mark in the fourth quarter. In early 1995, the yen has weakened further to: 65.25 ¥/DM (10.1.1995).

3. European Union:

In this section, the cost competitiveness of the EU as a whole is examined. This analysis may obscure diverging developments among the Member States, which include Austria, Finland and Sweden. Intra-Union developments are presented in Section II.

The competitive position of the European Union relative to other industrial countries

In the fourth quarter of 1994, the nominal appreciation of the European currencies caused a 1% deterioration in the competitive position of the European Union (see Table 1). Relative unit labour costs remained unchanged. Compared with the third quarter the rate of nominal and real appreciation slowed down by 1%.

The European currencies started appreciating in the **first quarter of this year**. Since then, the cost competitiveness of the European Union has declined by 3%, which is less than the 5% nominal appreciation of its currencies. **The decline in European unit labour costs expressed in national currency illustrates the improved relative cost performance of the European Union.**

In the period before, the cost competitiveness of the EU manufacturing industry had been rising (see Graph 3). **Between the third quarter of 1992 and the fourth quarter of 1994, it improved by a total of 16%**, in spite of a 2% rise in relative unit labour costs. **This gain in cost competitiveness** should therefore be attributed to the nominal depreciation of the European currencies (18%).

Before the ERM crises, the nominal and real exchange rates of the European currencies had been on an upward trend and competitiveness had deteriorated. If one considers all of the period **since the first quarter of 1987, however, the cost competitiveness of the EU manufacturing sector has remained unchanged**. A 10% rise in relative unit labour costs has practically offset a 9% currency depreciation in nominal terms.

The rise in relative unit labour costs in the Union's economy as a whole, on the other hand, has been much less significant (5%). The use of this indicator of European cost performance leads one to believe that the macroeconomic competitiveness of the Union has got better since the Louvre agreement.

Another indicator pointing in this direction is the relative export profitability of the European economy. This measure has gone up by 9%, which is clearly better than the deterioration of 2% and 10% recorded for the US and Japanese economies, respectively (see Table 2). The 14% rise in European export prices (expressed in national currencies) has been the main cause of the rise in the export profitability of the Union.

***The competitive position of the European Union
relative to the United States and Japan***

In the fourth quarter of 1994, the competitive position of the Union weakened (see Table 3). The European currencies continued to appreciate relative to the US dollar and the Japanese yen. The rate of appreciation relative to the US dollar, however, slowed down significantly (to 1% in both nominal and real terms), as the Union's unit labour costs started to decline relative to those in the United States. European unit labour costs continued to rise more rapidly than the Japanese, which contributed to the 2% loss in the Union's competitiveness relative to Japan.

Since the first quarter of 1994, when the European currencies started to appreciate relative to the dollar, the total loss in EU cost competitiveness relative to the United States amounts to 8%. The loss relative to Japan has been limited to 1% only.

Japan	1.1	0.1	1.2	-31.0	2.7	-29.2	-30.8	18.8	-17.8

Source : DG II.D.4 EC

(1) NEER = Nominal Effective Exchange Rate. A minus means a depreciation of the NEER.

(2) ULC = Relative Unit Labour Costs (in national currency).

(3) REER = Real Effective Exchange Rate = relative unit labour costs (in common currency).

A minus means an improvement in cost competitiveness.

In spite of this recent deterioration, the competitive gains achieved since the first EMS crisis in 1992 have not been cancelled out (see Graph 4). Since the third quarter of 1992, the European Union has recorded an 12% improvement in its cost competitiveness relative to the US. The improvement relative to Japan was substantially larger (27%). These gains have been caused by the depreciation of the European currencies relative to the US dollar (13%) and the Japanese yen (31%). Increases in EU manufacturing unit labour costs, especially in relation to Japan, have had a negative effect (see Table 3).

The cost performance of the EU economy as a whole has been slightly better. The rise in unit labour costs relative to Japan since the EMS crisis is limited to 3%. Relative to the United States the Union has even reduced its unit labour costs by 3%.

Since the first quarter of 1987, the competitive position of the European manufacturing industry has deteriorated by 19% relative to the United States, but improved by 13% relative to Japan.

The entry of Austria, Finland and Sweden into the European Union

The 1995 enlargement has improved the competitive position of the Union. Austria, Sweden and especially Finland have notched up large gains in manufacturing competitiveness since the conclusion of the Louvre Agreement in the first quarter of 1987 (see Table 4 on Page 11). Austria and Finland gained by significantly reducing their unit labour costs, while Sweden and Finland both benefited from the depreciation of their currencies.

Graphs 5, 6 and 7 reveal that the Austrian schilling clearly belongs to the core group of European currencies. Developments in exchange rates and macroeconomic competitiveness closely mirror those in countries like Belgium, France and the Netherlands.

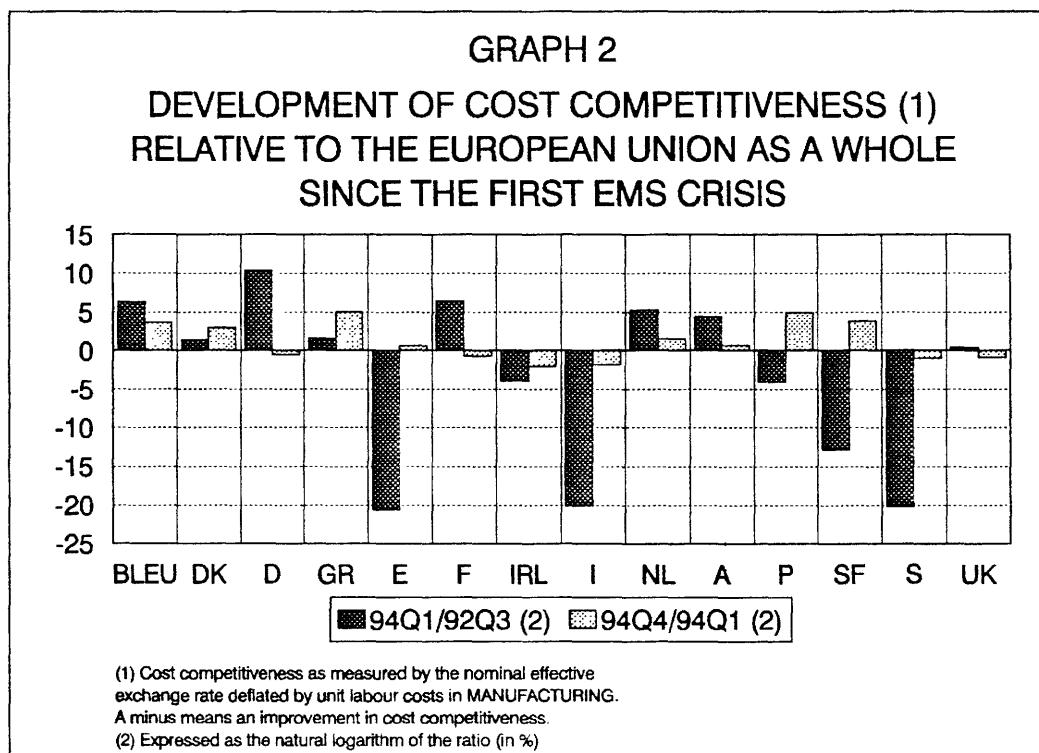

A focus on the period since the first EMS crisis illustrates the similarities between developments in Sweden and those in Spain and Italy (see Graph 2). In all three countries budgetary problems have led to a large nominal and real depreciation of the national currency.

Finland is a unique case. Its currency is fast gaining strength and recovering from the crisis linked to the collapse of the Soviet empire. The markka is backed up by economic restructuring that has led to rapid reductions in manufacturing unit labour costs (see Table 4).

II. INTRA-UNION DEVELOPMENTS

Since the first quarter of 1994, the larger Union Member States have made small gains in cost competitiveness. The largest losses occurred in smaller countries on the Union's periphery: Greece, Portugal and Finland. Still, as Graph 2 illustrates, markets have calmed down. Changes in real effective exchange rates over the course of the past year were less significant than those observed in the period before.

Looking back at the EMS crises, we can conclude that Germany suffered the largest loss in competitiveness (around 10%). Spain, Italy and Sweden were the largest 'winners'. The depreciation of their currencies improved their cost competitiveness by around 20%. Finland was another major winner, partially due to its excellent cost performance.

A more detailed analysis of recent developments shows that the **fourth quarter** decline in manufacturing cost competitiveness was particularly severe in Finland (see Table 4). The Finnish markka appreciated by 6% in nominal terms and 5% in real terms. It benefited from the vote to join the European Union, buoyant economic growth and a large trade surplus, indicating that the country has recovered from the negative repercussions of economic reform in the former Soviet Union. The Swedish crown appreciated by 3% in nominal and real terms in the **fourth quarter of 1994**. The economic recovery in the Scandinavian countries and the Swedish entry into the EU are

economic recovery in the Scandinavian countries and the Swedish entry into the EU are positive elements. However, a continuation of this upward trend is by no means certain in light of the serious budgetary problems facing Sweden. The British pound was the one other currency that appreciated in the fourth quarter. The strength of the pound following rate hikes by the Bank of England and the passage of the 1995 budget is a positive sign for the British economy. The continued rise in relative unit labour costs leading to a loss in cost competitiveness of 2% in the fourth quarter is a cause of worry over the longer term.

Amongst the Union's currencies, the Italian lira depreciated most rapidly (by 2% in nominal and real terms). The on-going tensions in the fragile coalition government and its eventual fall are the evident cause of the weakness of the lira. The Italian trade performance is improving in line with the increased cost competitiveness of its economy. The Greek drachma also continued to slide downward (by 1% in nominal terms), but the competitiveness of the Greek manufacturing industry failed to improve because of the 3% increase in relative unit labour costs.

The currencies participating in the Exchange Rate Mechanism of the European Monetary System stabilised in nominal terms. Developments in the fourth quarter clearly illustrated the correlation between participation in the ERM and exchange rate stability. The Spanish peseta and the Portuguese escudo were a little weak but nothing of major consequence. The Irish punt was the strongest currency in the grid due to strong economic fundamentals. The crisis in the Irish government had little or no long-term effect.

Most of the ERM currencies achieved small gains in cost competitiveness. Only in Denmark, Portugal and the BLEU did a rise in relative unit labour costs bring about an appreciation of the real effective exchange rate (see Table 4).

Since the September 1992 EMS crisis, the Belgian franc, the Danish crown, the German mark, the French franc, the Dutch guilder and the Austrian schilling have appreciated significantly. The nominal rate of appreciation varies from 7% (Belgian franc) to 11% (German mark). All of these currencies, with the notable exception of the Belgian franc, have benefited from reductions in relative unit labour costs ranging between 1% (German mark) and 4% (Danish crown). Still, these reductions were largely insufficient to prevent losses in cost competitiveness for the countries which form the core of the European Monetary System. Losses ranged from 4% for Denmark to 10% for Belgium (see Table 4).

The two other Union Member States with a deteriorating competitive position are Greece (by 7%) and Portugal (by 1%). Greece has the most rapidly rising unit labour costs in the Union (by 22% since the third quarter of 1992) and Portugal comes in second place (10%). The rate of depreciation of, respectively, the drachma (13%) and the escudo (8%) has been insufficient to offset the negative consequences of the rising labour costs.

Source : DG II.D.4 EC

(1) NEER = Nominal Effective Exchange Rate. A minus means a depreciation of the NEER.

(2) ULC = Relative Unit Labour Costs (in national currency).

(3) REER = Real Effective Exchange Rate = relative unit labour costs (in common currency).

A minus means an improvement in cost competitiveness

The large nominal depreciation of the Spanish peseta (16%) , the Italian lira (21%) and the Swedish crown (18%) following the crises in the EMS has led to important gains in manufacturing cost competitiveness for Spain (18%), Italy (20%) and Sweden (19%). The gains for the Ireland (6%) and the UK (1%) have been significantly smaller.

Finland is a quite separate case. The 10% reduction in relative unit labour costs far exceeds all achieved in any other Member State. This reduction in labour cost has led to 9% improvement in competitiveness.

If we go back further in time, however, changes in relative unit labour costs (expressed in national currency) become more important as an explanatory factor of the cost competitiveness of a country's manufacturing industry. In the long run, currency depreciation is a less effective tool for improving competitiveness. The Union's most peripheral countries provide the best illustration.

Since the Louvre agreement, Ireland (27%) and Finland (21%) have been able to significantly reduce their unit labour costs in manufacturing. Consequently, their industries **have gained a very strong position in international markets**. Irish cost competitiveness is up by 27% and that of Finland by 28%. **On the other side of the spectrum we find Greece and Portugal.** Manufacturing unit labour cost in Greece and Portugal have been rising by 129% and 65%, respectively, leading to important losses in cost competitiveness.

In the more centrally located countries, currency fluctuations and perceptions of economic and political stability appear to play a more important role.

The 18% gain in Italian cost competitiveness since the Louvre agreement has been caused by the nominal depreciation of the lire, while the **13% German loss** is clearly associated with the central position of the Deutsche Mark in the European Monetary System.

PRICE AND COST COMPETITIVENESS: TABLES AND CHARTS

- Tables and charts containing indices of COMPETITIVENESS derived from indices of NOMINAL EFFECTIVE EXCHANGE RATES and PRICE AND COST PERFORMANCE are attached hereafter.

Period coverage : 1976-1994/Q4
 Base period : 1987 = 100

The EC12, the EU 15 and 20 INDUSTRIAL COUNTRIES are presented in the following order:

(1) EC12	(8) France	<u>Non-EU Europe</u>
(2) EU15	(9) Ireland	(17) Norway
<u>EU-countries</u>	(10) Italy	(18) Switzerland
(3) BLEU	(11) Netherlands	<u>Non-Europe</u>
(4) Denmark	(12) Austria	(19) Australia
(5) Germany	(13) Portugal	(20) Canada
(6) Greece	(14) Finland	(21) Japan
(7) Spain	(15) Sweden	(22) USA
	(16) United Kingdom	

Each country (or country bloc) is compared with (other)

- * INDUSTRIAL COUNTRIES
- * 12 EUROPEAN UNION COUNTRIES OF 1994
- * 15 EUROPEAN UNION COUNTRIES OF 1995

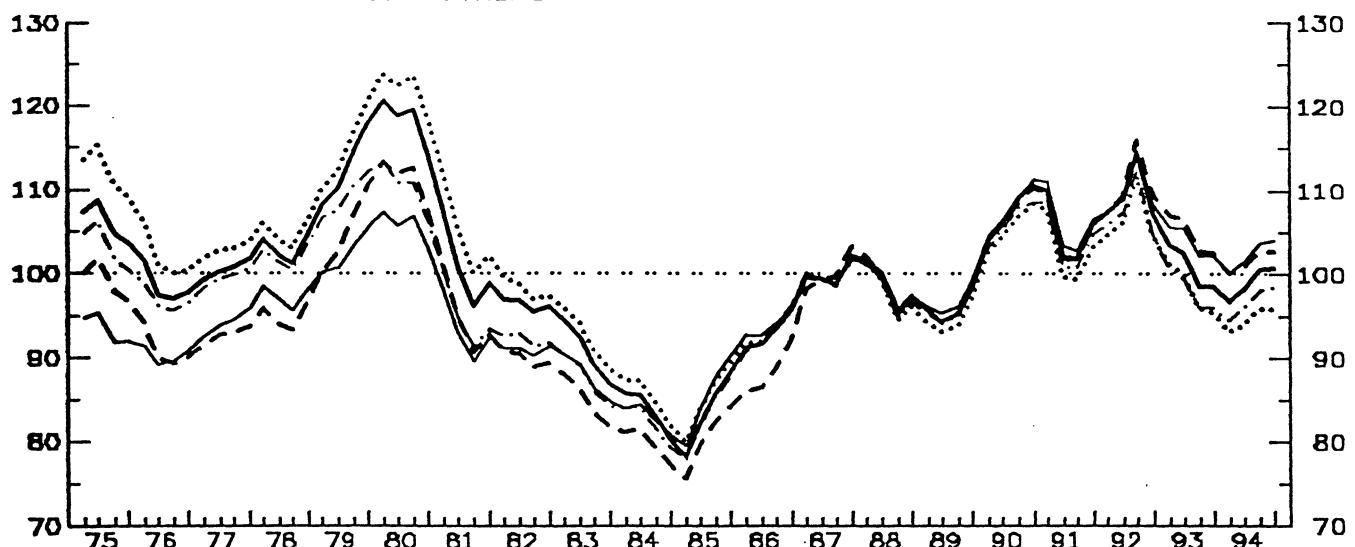

National price and cost indices (in national currency and in USD) and bilateral USD exchange rates for all countries are given in tables on the last 6 pages of the dossier.

A brief technical annex is attached.
