PRICE AND COST COMPETITIVENESS

ECFIN/C-1

Third quarter 2000

Quarterly report on the price and cost competitiveness of the European Union and its Member States

PRICE AND COST COMPETITIVENESS

QUARTERLY REPORT – THIRD QUARTER 2000

This series of quarterly reports provide a periodic assessment of the **price and cost competitiveness of the euro area and the individual Member States of the European Union**. *Part 1* offers an overview of international and intra-EU price and cost competitiveness positions. *Part 2* is a data section which provides data for the euro area, for each Member State, as well as for five other industrial countries (United States, Japan, Norway, Australia, and Canada).

The **nominal effective exchange rate (NEER)** of a country (or currency area) aims to track changes in the value of that country's currency relative to the currencies of its principal trading partners. It is calculated as a weighted average of the bilateral exchange rates with those currencies.

Changes in cost and price competitiveness depend not only on exchange rate movements but also on cost and price trends. The **real effective exchange rate (REER)** aims to assess a country (or currency area's) price or cost competitiveness relative to its principal competitors in international markets. It corresponds to the NEER deflated by selected relative price or cost deflators.

Countries in the euro area share a single currency and there is no longer any exchange rate between them. For these countries, the terms "nominal effective exchange rate" and "real effective exchange rate" have been replaced by the terms "**trade-weighted currency index**" and "**relative price and cost indicators**" but the underlying concepts and their calculation remains the same. The trade-weighted currency indices for individual countries using the euro may diverge because they have different trading patterns. In addition, the relative price and cost indicators may evolve differently due to diverging price and cost trends.

A comprehensive assessment of developments in cost and price competitiveness should ideally draw on various measures of the real effective exchange rate. Most international trade is in manufactured goods and some widely used measures focus on **unit labour costs in the manufacturing industry (ULCM)**. However, in-house labour costs account for only a limited share of total costs in the manufacturing industry. The sector purchases a growing amount of inputs from the rest of the economy, including financial services, marketing, accounting etc. In addition, an increasing amount of services are traded internationally. Therefore, some prefer to consider developments based on **unit labour costs in the whole economy (ULCE)**. Moreover, capital costs account for a sizeable fraction of total costs. Price measures such as the **GDP-deflator (PGDP)** include the return on capital. On the other hand, the measures based on ULCE and PGDP cover many sectors whose output is neither directly nor indirectly traded. The discussion in Part 1 focuses on real effective exchange rates as measured by unit labour costs in the whole economy, but Part 2 of the report also shows real exchange rates based on the deflator of private consumption, and the deflator of exports of goods and services (PX).

1994 is taken as the base period for the indicators of price and cost competitiveness. This does not imply that 1994 exchange rates should be treated as equilibrium rates.

The quarterly report is also available on the Internet. Our Web site, "http://www.europa.eu.int/comm/economy_finance/document/pccr/pccr_en.htm", permits the downloading of standard statistics to your PC or Macintosh. Moreover, differently defined nominal and real exchange rates are available upon request. A technical annex provides further details.

PART 1

**DEVELOPMENTS IN
THE COST COMPETITIVENESS OF
THE EUROPEAN UNION,
THE UNITED STATES AND JAPAN**

DEVELOPMENTS IN THE COST COMPETITIVENESS OF THE EUROPEAN UNION, THE UNITED STATES AND JAPAN

MAIN FEATURES

The euro against major international currencies:

- During the third quarter of 2000, the US dollar, the Japanese yen and the pound sterling appreciated against the euro, by respectively 8.1%, 7.6%, and 3.4% qoq. In the same period, the Swiss franc appreciated by about 2%. In all, the nominal effective exchange of the euro depreciated by nearly 5% against the currencies of 13 industrialised countries.
- By the end of the third quarter, the nominal effective exchange rate of the euro has depreciated by about 15% since the changeover on 1 January 1999.

Relative cost and price indicators: international developments

- Together with subdued price and cost increases, exchange rate developments led to an additional gain in the cost competitiveness of euro area producers (against other industrialised countries) of about 2% in the third quarter of 2000, leading to a total gain of 18% since the launch of the euro.
- In a longer-term perspective, unit labour costs relative to EUR11 are 38.5% above their 1987-99 average in the United States and 35.5% above their 1987-99 average in Japan.

Relative cost and price indicators: intra-EMU developments

- Over the *last two years*, the Netherlands, Finland, Spain and Portugal saw a deterioration in cost competitiveness relative to EMU partners. In these countries, cost and price pressures are related to their strong cyclical position and, in some cases, to a catching-up process. In contrast, moderate wage increases or weaker cyclical position lead to an improvement in intra-EMU cost competitiveness in France and Germany.
- In a *longer time perspective*, intra-EUR11 cost competitiveness is considerably better than its 1987-99 average in Finland (about 9%), while it is considerably worse than this average in Portugal (about 18%).

Relative cost and price indicators: Member States outside the euro area

- Denmark has seen a further deterioration in its unit labour cost competitiveness against the EUR11 over the last two years (about 4%) and relative to its 1987-99 average (about 8%). In Greece, cost competitiveness based on ULCM improved over the last year by about 3%, but relative unit labour costs are still 14% higher than their 1987-99 average.
- Because of the strengthening of the pound, unit labour costs in manufacturing in the UK remained some 49% higher than their 1987-99 average relative to EUR11 in the third quarter of 2000. In Sweden, cost competitiveness worsened by about 6% relative to the euro area over the last year.

PRICE AND COST COMPETITIVENESS

QUARTERLY REPORT - THIRD QUARTER 2000

I. INTERNATIONAL DEVELOPMENTS

1. BILATERAL EXCHANGE RATES OF THE EURO

Since its launch, the euro has been on a steady depreciating trend against most major world currencies, which was only occasionally and briefly interrupted (Chart 1 and 3). Although the euro has subsequently bounced back in the month to mid-June, it has then fallen again.

The *dollar/euro* exchange rate has attracted most attention in the past one and half years. Having started at 1.17 dollar per euro at launch, the euro fell below parity with the US dollar for the first time in December 1999 and temporarily below USD 0.86 in early September; a level corresponding to a decline of about 26% percent compared to January 1999. On the 20 September 2000, the euro has fallen below 0.85. G-7 Central Banks intervened on Friday 22 September in support of the euro, in the first joint action since 1995. The ECB, the US Federal Reserve and the Bank of Japan referred to a "shared concern for the potential implications of developments in the euro exchange rate for the world economy". The intervention lifted the euro from \$0.86 to \$0.90, a gain of more than 5%¹ but the euro eased to below \$0.89 thereafter.

Despite this intervention, the dollar had not been so strong against the participating euro currencies since late 1985. The US economy grows still above potential without any imminent inflationary pressures, and the last productivity growth figure (5.7% in the second quarter) has confirmed this trend.

Source: European Commission

¹ from 90 to 96 Japanese yen, from 0.60 to 0.61 Pound Sterling, and from 1.51 to 1.53 Swiss franc

The euro has experienced an even larger depreciation against the *Japanese yen*. From 134 yen per euro on 4 January 1999, the euro fell to a low of JPY 90 in September. Since the launch of the euro, the Japanese yen appreciated by 29% against the euro. Despite foreign exchange market interventions of the Japanese authorities to stop the rise of the yen (in December 1999 and March 2000), the Japanese currency has remained on an upward trend against the euro (cf. chart 2). Moreover, the gradual recovery of the Japanese economy and the move from the zero interest rate monetary policy further supported the Japanese yen.

Against the *Pound Sterling*, the euro is down 13.5% since the changeover (cf. Chart 3). However, the pound sterling has depreciated substantially against the dollar (it is currently at its lowest level against the dollar in 15 years). After the strong recovery of the UK economy in the course of 1999, there are signs of a slow down, in particular in the exposed sector. The Bank of England maintained its repo rate at 6% since February 2000.

Chart 3 The euro against GBP and CHF since changeover

Index 1.1.1999 = 100

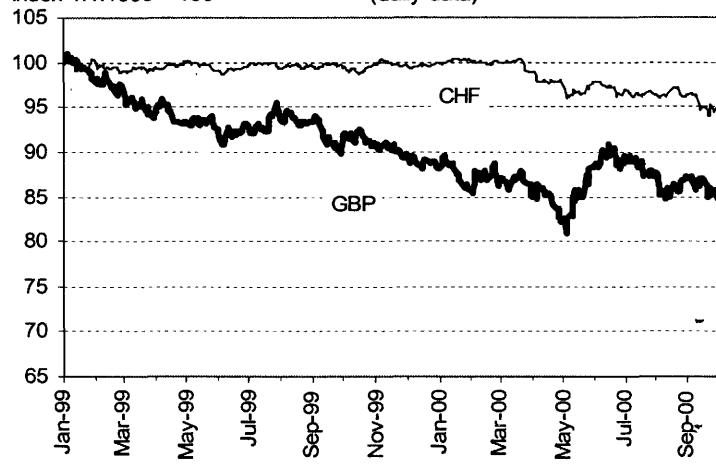

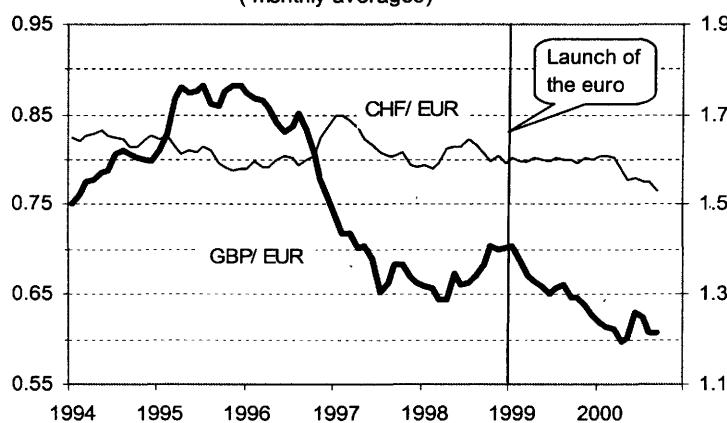

Chart 4 The euro (DM) against GBP and CHF since 1994

GBP/EUR

(monthly averages)

CHF/EUR

Note: EUR rates before 1999 calculated on the basis of DEM rates.

Source: European Commission

The *Swiss franc*, is also at its lowest level in 10 years against the dollar. It is currently trading at around 1.52 CHF/EUR, which corresponds to an appreciation of around 2% against the euro.

TABLE 1: EVOLUTION OF THE MAIN BILATERAL EXCHANGE RATES

| | During the third quarter of 2000 (monthly averages) | | | Relative to the previous quarter (quarterly averages) | | |
|---------|--|-------------------|----------|--|------------------|----------|
| | Average Jun-00 | Average Sep-00 | % change | Average Q2-00 | Average Q3-00 | % change |
| USD/EUR | 0.949 | 0.872 | -8.1% | 0.934 | 0.905 | -3.1% |
| JPY/EUR | 100.7 | 93.1 | -7.6% | 99.6 | 97.4 | -2.2% |
| GBP/EUR | 0.6292 | 0.6077 | -3.4% | 0.6095 | 0.6127 | 0.5% |
| CHF/EUR | 1.561 | 1.531 | -1.9% | 1.564 | 1.544 | -1.3% |

2. NOMINAL EFFECTIVE EXCHANGE RATES (IC24)

Since its launch, the nominal effective exchange rate of the euro has depreciated significantly. The depreciation resulted from a generalised downward movement vis-à-vis most main currencies. In September 2000, the nominal effective exchange rate of the *euro* area countries reached its lowest level since December 1989. At this level, it is 15% below its changeover level, some 5% of which happened in the third quarter of 2000.

The nominal effective exchange rate of the *US dollar* reached its highest level ever in September (cf. chart 6). It gained about 3% relative to the previous quarter.

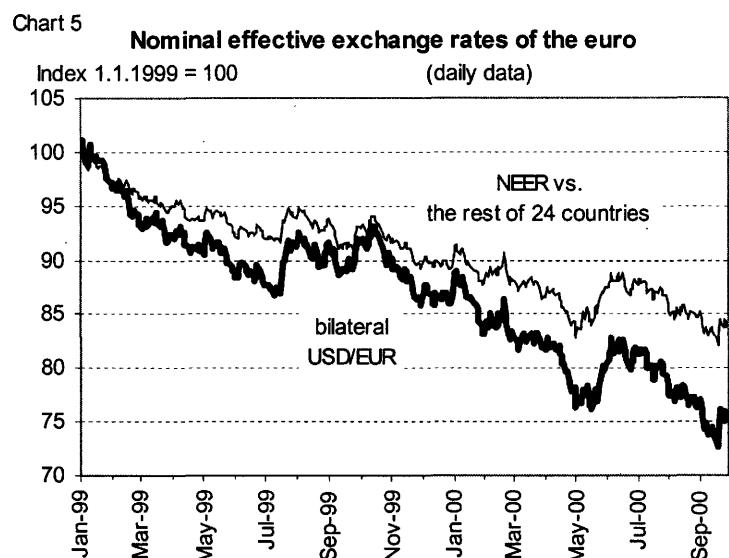

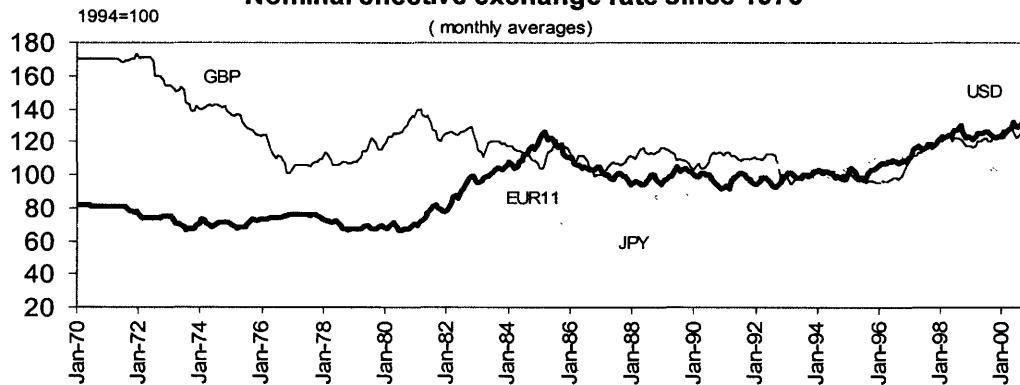

Chart 6

Nominal effective exchange rate since 1970
(monthly averages)

Source: European Commission

The nominal effective exchange rate of the *Japanese yen* gained 3.1% during the third quarter, and is very close to its high reached in 1995.

The nominal effective exchange rate of the *Pound sterling* depreciated during last quarter when it reached its highest level since 1983, but is still high from a historical point of view.

TABLE 2: NOMINAL EFFECTIVE EXCHANGE RATES
(vs. 24 industrialised countries, index 1994 = 100)

| | During the third quarter of 2000 (monthly averages) | | | Relative to the previous quarter (quarterly averages) | | |

Source: European Commission

3. REAL EFFECTIVE EXCHANGE RATES (IC24)

As a result of the depreciation of the euro and low price and cost inflation in the euro area compared to trading partners, the cost competitiveness of the *euro* area improved. In the third quarter of 2000 it gained nearly 2%, and registered an improvement of 19% since the launch of the euro (measured by relative unit labour costs in the economy as a whole). EUR11 cost competitiveness reached its most favourable level ever in September 2000 (cf. Chart 7).

Over the last year, the strength of the *US dollar*, notably against the euro, the pound sterling and the Japanese yen, led to a deterioration in the cost competitiveness of the US economy. The real effective exchange rate of the USD is very high from a historical point of view as it stands 16% above its 1987-99 average. This is its highest level since 1986 (cf. Chart 8).

Despite the fact that the real effective exchange rate of the *Japanese yen* has decreased somewhat against the euro during the third quarter (- 0.1% over the third quarter), it is still about 12% higher than its 1987-99 average.

The cost competitiveness of the UK has somewhat improved over the third quarter as the real effective exchange rate of the *Pound sterling* decreased by 1%. However, the real effective exchange rate is still close to its all-time high at some 24% above its 1987-99 average.

4. COST COMPETITIVENESS OF THE EURO AREA RELATIVE TO THE USA AND JAPAN

Over the last year, the strengthening of the US dollar against the euro has contributed to a loss in cost competitiveness for US producers against their EUR 11 competitors of around 18%, some 4 percentage points of which occurred during the third quarter of 2000. Unit labour costs in the United States relative to EUR11 are some 38.5% above their 1987-99 average. In a historical perspective, the unit labour cost position of euro area producers is currently very favourable relative to US producers, better than at any time since late 1985 (cf. chart 9). The cost competitiveness for EUR11 producers against their US competitors has improved by around 21% since the launch of the euro.

The appreciation in the Japanese yen from the third quarter of last year has contributed to a deterioration of 20% in cost competitiveness for Japanese competitors against EUR11 producers (and by 2% over the third quarter). Unit labour costs in Japan relative to EUR11 are almost 35.5% above their 1987-99 average. At this level, the cost competitiveness for EUR11 producers relative to Japan is more favourable than ever (cf. chart 9). The cost competitiveness for EUR11 producers against their Japanese competitors has improved by around 22.5% since the launch of the euro.

II. DEVELOPMENTS WITHIN THE EUROPEAN UNION

1. COST COMPETITIVENESS MOVEMENTS AMONG EURO AREA MEMBER STATES

Within the euro area, diverging movements in costs and prices may change the relative cost competitiveness positions of euro area Member States. Table 5 and Chart 10 show three measures of the real effective exchange rate of individual Member States against the EUR11 average. The different measures do not always give a uniform picture of the movement over time in the real effective exchange rate of a given country against its partners and, as such, the indicators of cost and price competitiveness need to be interpreted carefully.

In some cases, deviating price and cost trends among euro area Member States could lead to a build-up of competitive imbalances which might ultimately hamper economic growth and cause unemployment in individual Member States. In other cases, however, longer-term changes in relative prices and costs may be justified by changes in economic fundamentals related e.g. to a catching-up in the level of economic development, changes in non-price competitiveness factors, or changes in underlying savings and investment patterns. Moreover, differences in cyclical positions may cause movements in relative costs and prices in the short term. An in-depth assessment of movements in real exchange rates therefore requires a comprehensive analysis of the economic situation in each country seen in a longer time perspective. This report merely provides a descriptive overview of movements in intra-euro area cost and price competitiveness indicators.

Recent developments

The price and cost competitiveness in Belgium, Luxembourg and Italy has been broadly constant over the last two years.

• *Depreciation*

Over *the last year*, the intra-EUR11 real effective exchange rate depreciated in ***Germany, France and Austria*** (cf. table 5). While in France this reflects low cost pressures due to moderate wage pressure, in Germany low price pressure results from weaker cyclical conditions than for the average of the euro area. These trends reflect the trend observed over the last two years. The Austrian real effective exchange rate also depreciated, but to a lesser extent and therefore is still above its 87-99 average.

• *Appreciation*

Over the same period, there was an upward movement in the real effective exchange rates of ***Spain, Portugal, Finland, the Netherlands and Ireland***. In all five countries, above-average cost and price increases are related to a strong cyclical position.

The ***Irish*** case is somewhat peculiar. Although over the last two years there was a tendency for the Irish real effective exchange rate to appreciate, different measures of the real effective exchange rate did not all move in the same direction. In particular, the cost indicator based on manufacturing still. In Ireland, wage and price pressures are rising due to continued strong growth and an increasingly tight labour market. However, cost and price competitiveness remain quite favourable (in a historical perspective) and the current account is close to balance despite very strong domestic demand.

In the *Netherlands*, the upward movement of the real effective exchange rate should be viewed in the perspective of a sizeable real depreciation since the early 1980s and a large current account surplus despite strong domestic demand.

In *Spain* and *Portugal*, the appreciation of the real exchange rate may be warranted as the economy catches up with other euro countries and as they benefit from large inward capital flows following their participation in the euro. Nevertheless, the large current account deficit of Portugal may indicate an unwarranted loss in competitiveness.

TABLE 5: RELATIVE COST AND PRICE INDICATORS OF INDIVIDUAL COUNTRIES RELATIVE TO THE EURO AREA (EUR11)

| Non-euro area Member States | | | | | | | | | |
| % Change | ULCE | ULCM | PGDP | ULCE | ULCM | PGDP | ULCE | ULCM | PGDP |
| Denmark | 1.1 | -0.7 | 0.9 | 3.6 | 4.8 | 2.8 | 8.3 | 15.4 | 5.4 |
| Greece | -1.6 | -2.8 | -2.1 | 0.9 | -3.2 | 0.9 | 14.2 | 6.1 | 10.6 |
| Sweden | 5.3 | 3.9 | 4.4 | 5.6 | 3.4 | 5.9 | 3.3 | -6.5 | -0.7 |
| UK | 9.0 | 8.5 | 8.2 | 14.5 | 17.3 | 12.9 | 35.3 | 48.4 | 28.1 |

Note: relative ULCE and ULCM for Italy relative to any period before 1998 are distorted by the 1998 tax reform which shifted taxation from labour costs to value added but did not significantly change competitiveness.

- (1) ULCE = Based on unit labour costs in the economy as a whole.
- (2) ULCM = Based on unit labour costs in manufacturing industry.
- (3) PGDP = Based on GDP-deflator.

A minus means an improvement in cost competitiveness.

Source : European Commission

Relative to the 1987-99 period:

The large deviation from the 1987-99 average in the case of *Portugal* (rise of about 18% of the ULCE) could be related to the catching-up process which the country is undergoing. The real appreciation prior to 1992 may reflect an equilibrium response to the opening of the economy upon accession to the European Community in 1986. Relative unit labour costs in the manufacturing sector – which produces tradables – have been broadly constant since 1992.

The current price and cost competitiveness of *Finland* is significantly better (about 9%) than its 87-99 average. This large deviation is related to the economic shocks that occurred in the late 1980s/early 1990s, including the collapse of trade with the former Soviet Union. As the process of raising the utilisation of the economy's productive resources and reducing external debt makes progress, the real exchange rate relative to EMU partners may gradually appreciate in the medium term. However, in the

second half of the 1990s, Finish productivity picked-up leading to an improvement of competitiveness. Moreover, the Finnish economy is likely to be more exposed to the global and domestic growth of sectors associated with the “new economy”, and this may have consequences for the real exchange rate.

Ireland is unusual in that it has witnessed a trend depreciation in its ULC-based real exchange rate during the last decade of its catching-up process (cf. chart 10). To a large extent, large productivity gains in the manufacturing sector have been achieved by (and in any case accompanied by) a large increase in the capital-intensity of production related to the inflow of capital-intensive investment during the 1980s and 1990s. The substantial decline in the ULC-based indicators reflects a shift in the relative factor content of output rather than declining costs at the firm level or an exchange rate depreciation.

For the remaining countries, the measures of the real effective exchange rate either show modest differences with the 1987-99 average (i.e. **Austria**) or the various indicators convey conflicting messages with some measures above and some below their 1987-99 average.

2. COST COMPETITIVENESS BETWEEN THE EURO AREA AND OTHER MEMBER STATES

Denmark has seen a further deterioration in its unit labour cost competitiveness over the last two years (by about 4%), and the real effective exchange rate based on ULC in the manufacturing sector is some 15% higher than its 1987-99 average. This reflects both faster wage increases and lower productivity growth in Denmark than in the euro area in recent years.

After several years of real exchange rate appreciation, the devaluation of the **Greek** drachma upon its entry into the ERM in March 1998 resulted in a significant depreciation in real effective terms. However, due to the strength of the Greek drachma in the ERMII and higher price and cost increases, the real effective exchange rate of Greece against EUR11 has increased. Despite the amelioration of the Greek price and cost competitiveness over the last year, the Greek drachma, in real terms, is still well above its long-term average (+ 14% for ULCE).

Exchange rate developments have led to a further deterioration in the price and cost competitiveness of the **United Kingdom** relative to the euro area of about 9% (ULCE) over the last two years. ULC for the economy as a whole are 35% higher than their 1987-99 average and nearly 49% higher in the case of manufacturing industry.

In **Sweden**, cost and price competitiveness worsened by about 5% relative to the euro area over the last year, mainly because the Swedish krona recovered on the back of a strong pick-up in the Swedish economy. In real effective terms, the krona is close to its average over the 1987-99 period relative to the EUR11, although unit labour cost in manufacturing are some 6.5% below their 1987-99 average.

Chart 10 : Price and cost indicators for individual countries relative to EUR11

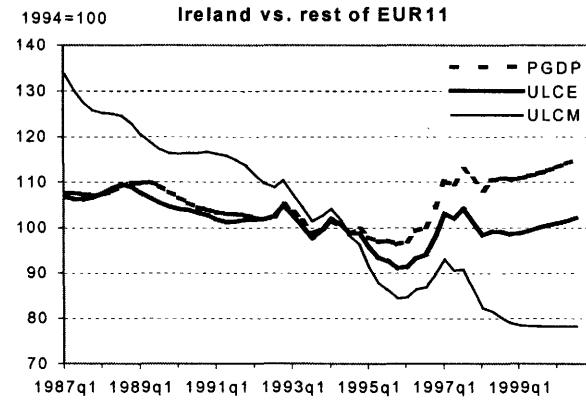

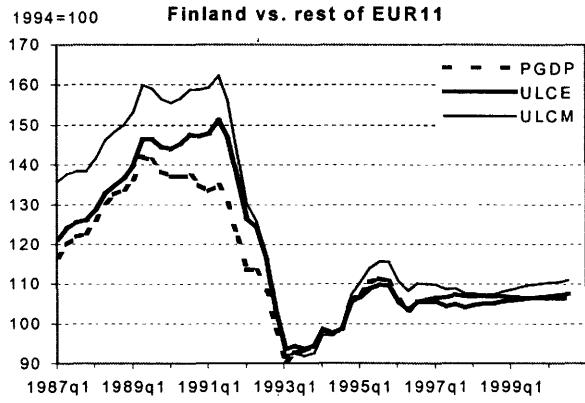

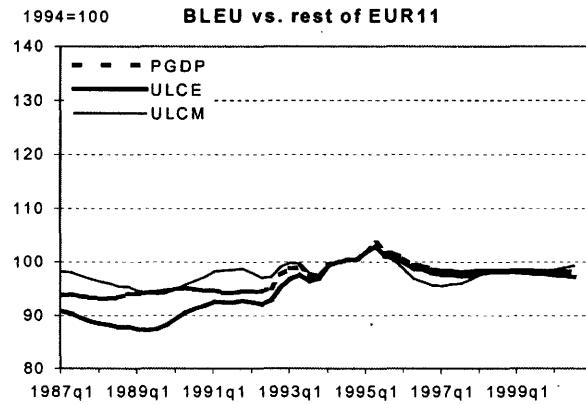

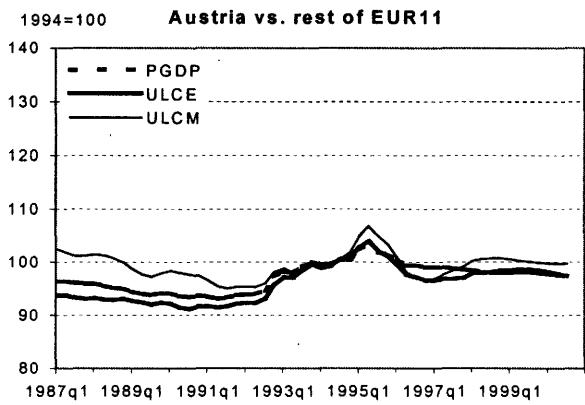

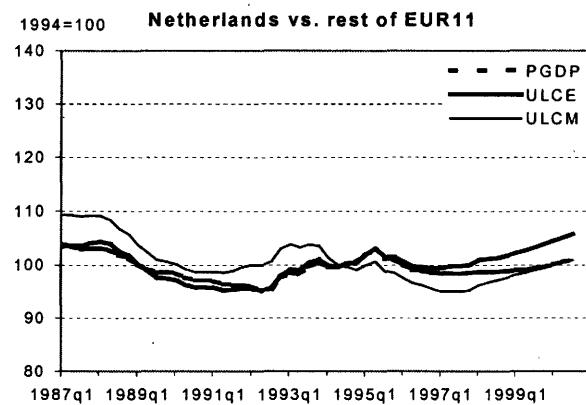

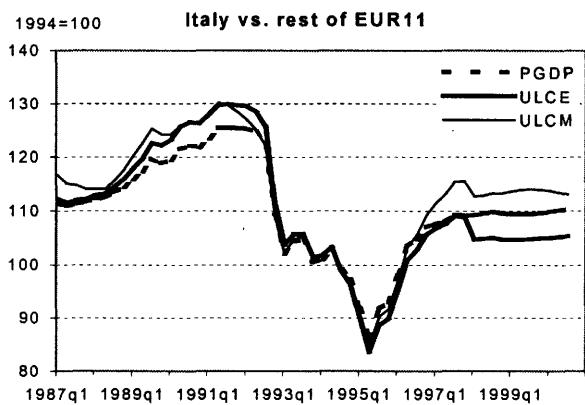

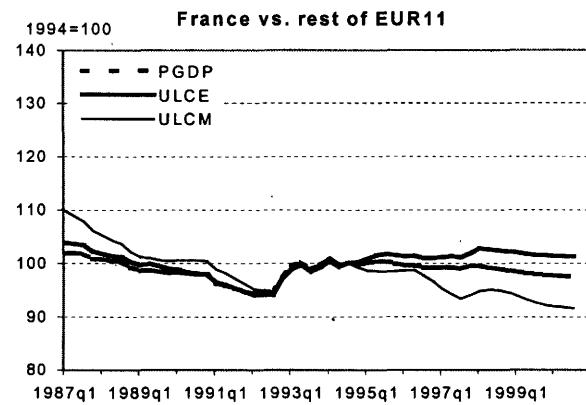

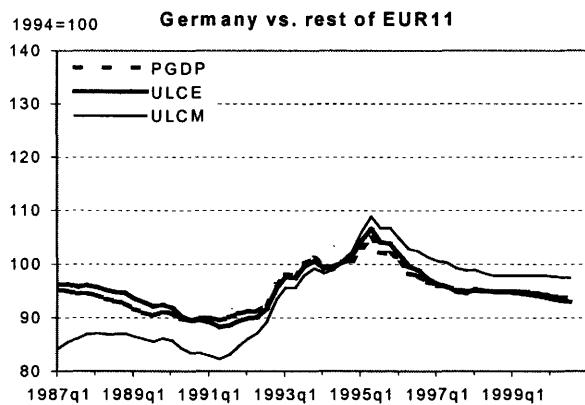

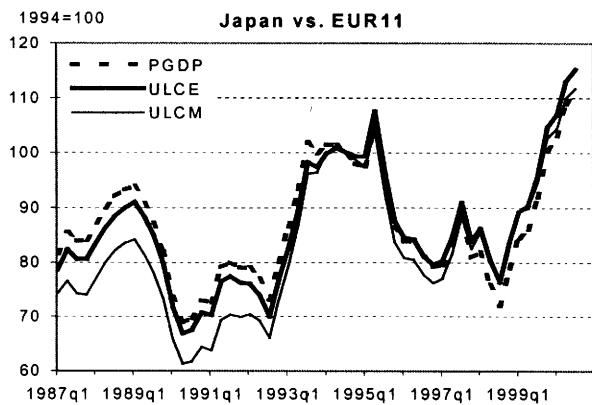

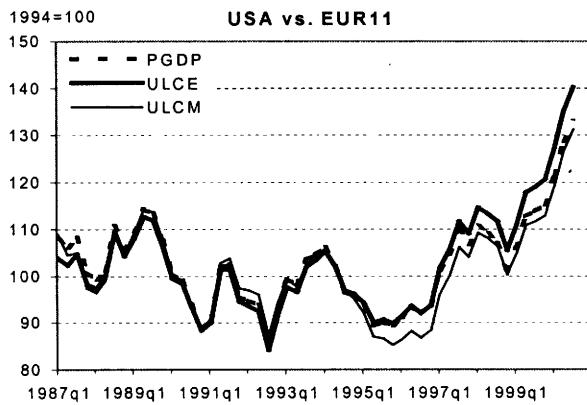

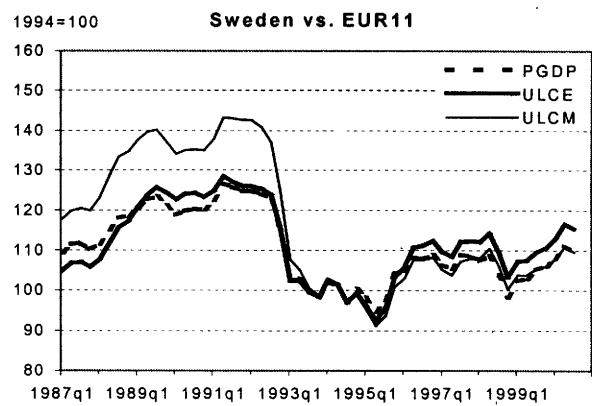

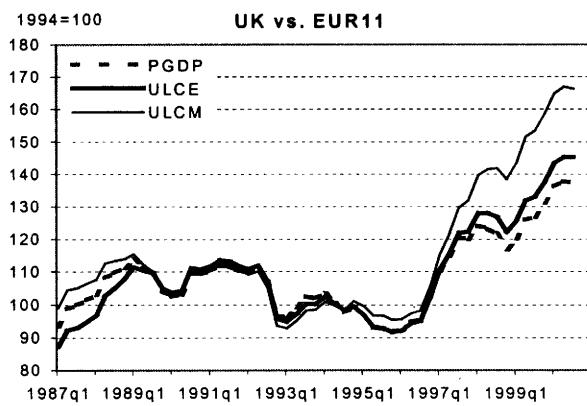

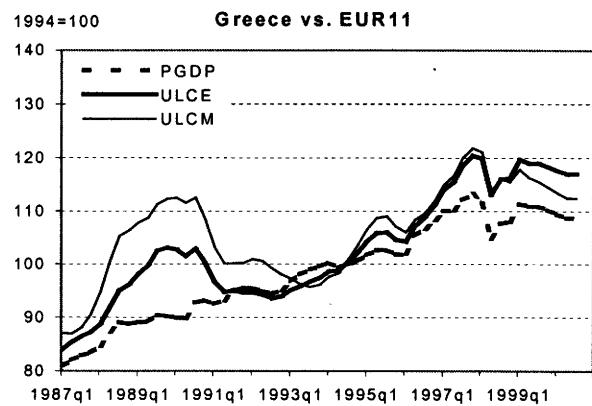

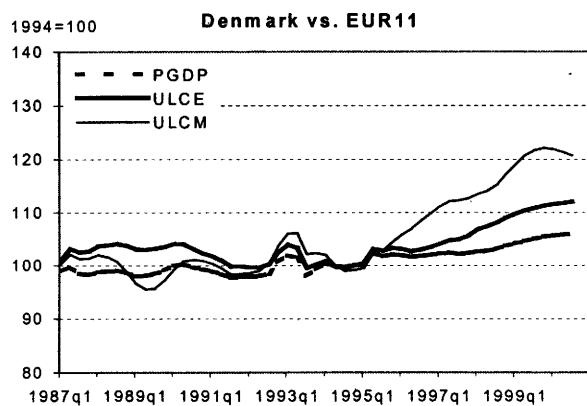

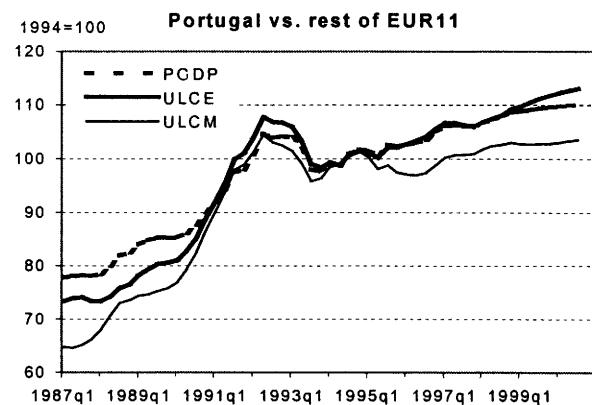

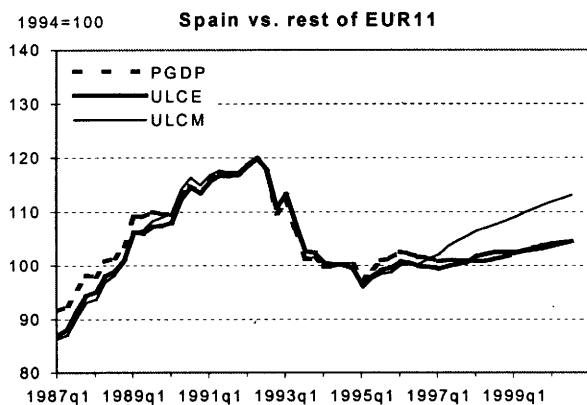

Chart 10 contd.: Price and cost indicators for individual countries relative to EUR11

PART 2

**TABLES AND GRAPHS
BY COUNTRY**

PART 2:

TABLES AND GRAPHS BY COUNTRY

The tables and graphs on **Pages 1 to 40** present nominal and real effective exchange rates of the currencies of the European Union Member States and five other industrial countries. Aggregate measures for the European Union as a whole (EU-15) and the group of countries participating in the Economic and Monetary Union (EUR11) are presented as well. Each country (or country group) is compared with 24 industrial countries (the 15 EU countries, Norway, Australia, Canada, Japan, the United States, Mexico, New Zealand, Turkey and Switzerland), with the European Union and with the group of ERM participants.

The tables on **Pages 41 to 51** present bilateral exchange rates of the US dollar against the currencies of the 24 industrial countries; and nominal and real effective exchange rates of the EU currencies, the US dollar and Japanese yen (as well as aggregate measures for EU-15 and EUR11). Each cross-national table of real effective exchange rates is based on a single price or cost deflator. Price and cost indices in national currency are presented as well. These tables aim to facilitate a comparison of developments in the different industrial countries. The final table shows the latest double export weight matrices that were used to calculate effective exchange rates.¹

¹ The technical annex provides further details.

TECHNICAL ANNEX

INTRODUCTION

The quarterly report on price and cost competitiveness presents recent changes in the nominal and real effective exchange rates of the euro area (EUR11), of the 15 individual EU Member States, as well as of the United States, Japan, Norway, Australia, and Canada (part 2). Aggregate measures for the European Union (EU-15) are presented as well.

The nominal effective exchange rate (NEER) (or, equivalently, the "Trade-weighted currency index") describes changes in the average value of a currency with reference to a given base period and a given group of reference countries. It is calculated as a weighted geometric average of the bilateral exchange rates against the currencies of competing countries. In this report, three alternative groups of competitor countries are considered: a group of 24 industrial countries (IC24), the 15 Member states of the European Union (EU-15) and the countries in the euro area (EUR11).

The real effective exchange rate (REER) (or, equivalently, the "Relative price and cost indicators") is calculated as the sum of the nominal rate and a trade-weighted price or cost deflator. The REER attempts to show the movement in the prices or costs of production of domestically produced goods relative to the prices or costs of goods produced by competitor countries, when expressed in a common currency.

Double export weights are used to calculate NEERs and REERs, reflecting not only competition in the home markets of the various competitors, but also competition in export markets elsewhere.

DG II's system for the calculation of effective exchange rates permits the user to make individual choices of competitor countries, reference period, method to calculate trade weights and, in the case of real effective exchange rates, price or cost deflators. This technical annex describes the standard measures used in this series of Quarterly Reports. Differently defined nominal and real exchange rates can be provided to interested persons or organisations upon request. Please fax your request to the European Commission, Directorate-General for Economic and Financial Affairs (DG ECFIN-C-1), fax n° +32-2-299.35.05.

METHOD

1. Choice of reference period

The choice of the reference period in assessing developments in nominal and real effective exchange rates is necessarily arbitrary and should not be seen as implying that exchange rates prevailing in this reference period were in equilibrium.

The reference year is 1994.

2. Calculation and application of trade weights (that transform the bilateral exchange rates into effective exchange rates)

The trade weights used are double export weights. This implies that the bilateral exchange rates between the currency of a given country and the currencies of its competitor countries are weighted according to both:

- (1) the competitors' share in the total supply of competing goods (including the supply by domestic producers) in each market separately; and
- (2) the relative share of each market in the total exports of the given country.

Moving weight matrices are used in order to capture the influence of changing trade patterns over time. The weight matrices of year t-1 are used to calculate the change in the effective exchange rate between the year t and t-1. If no weights are available for the year t-1, the weights of the latest year available are used.

3. Price and cost deflators (to transform the nominal effective exchange rates into real effective rates)

Five real effective exchange rates (each based on a different deflator) have been calculated in order to provide a comprehensive assessment of a country's price and cost competitiveness. The following deflators have been used:

- (1) the deflator of private consumption (PCP);
- (2) the GDP deflator (PGDP);
- (3) the price deflator of exports of goods and services (PX);
- (4) Unit Labour Costs in Economy as a whole (ULCE); and
- (5) Unit Labour Costs in Manufacturing (ULCM).

4. German unification

The data used in the quarterly reports on price and cost competitiveness have been adjusted¹ to reflect the shift in the average level of unit labour costs, thereby better capturing the deterioration in average German cost competitiveness associated with unification. An estimate had to be made for the level shift in unit labour costs in the manufacturing sector. On the basis of data for value-added and employment in the manufacturing sector in subsequent years the productivity gap was found to be smaller in this sector. Average unit labour costs in manufacturing have been adjusted by 1.3 per cent from 1991 onwards.

¹ For more details, see the box on German unification and cost competitiveness box published in the first quarter 2000 report

DATA SOURCES

1. Nominal bilateral exchange rates and deflators

Exchange rate data for the current year are the official daily rates recorded at 14.15 hours by the ECB. Monthly data are calculated as the arithmetic mean of the daily rates. Quarterly and yearly data are geometric means of these monthly figures. Historical data are provided by the IFS (IMF) database.

Annual data for the deflators (including Commission forecasts for the current year) come from DG ECFIN's AMECO database. As the calculation of real effective exchange rates requires a full data set, missing data have been estimated. The annual data have been transformed into quarterly data by applying a straight-forward spline method.

2. Weight matrices:

The moving double export weight matrices are derived from trade matrices with domestic production for the home market on the diagonal. The source of data on bilateral exports is the DoT (IMF) database. The source of data on domestic production (defined as GDP - exports) is national accounts' data from AMECO. Table H in Part 2 of the report reproduces the most recent weight matrices used in calculating effective exchange rates.

COUNTRY COVERAGE

1. Competitors

The report presents nominal and real effective exchange rates relative to a group of 24 industrial countries (IC24), relative to the European Union as a whole (EU-15) and relative to the countries in the euro area (EUR11). IC24 consists of the 15 EU Member States plus United States, Canada, Japan, Switzerland, Norway, Australia, New Zealand, Mexico, and Turkey.

2. Markets

Besides the countries considered as competitors, the following markets are distinguished: other Europe (including the Central and Eastern European Countries and the countries that used to be part of the USSR), other Asia/Oceania, other Western hemisphere, Africa, the Middle East and the rest of the World (including North Korea and Cuba). The conventions used in DoT/IFS (IMF) are followed strictly with two exceptions: (1) the industrial countries are not treated as a separate category; (2) the former East and West Germany are considered as a single entity: Germany.
