PRICE AND COST COMPETITIVENESS

ECFIN/C-1

Fourth quarter 2000

Quarterly report on the price and cost competitiveness of the European Union and its Member States

PRICE AND COST COMPETITIVENESS

QUARTERLY REPORT – FOURTH QUARTER 2000

This series of quarterly reports provide a periodic assessment of the **price and cost competitiveness of the euro area and the individual Member States of the European Union**. *Part 1* offers an overview of international and intra-EU price and cost competitiveness positions. *Part 2* is a data section which provides data for the euro area, for each Member State, as well as for five other industrial countries (United States, Japan, Norway, Australia, and Canada).

The **nominal effective exchange rate (NEER)** of a country (or currency area) aims to track changes in the value of that country's currency relative to the currencies of its principal trading partners. It is calculated as a weighted average of the bilateral exchange rates with those currencies.

Changes in cost and price competitiveness depend not only on exchange rate movements but also on cost and price trends. The **real effective exchange rate (REER)** aims to assess a country (or currency area's) price or cost competitiveness relative to its principal competitors in international markets. It corresponds to the NEER deflated by selected relative price or cost deflators.

Countries in the euro area share a single currency and there is no longer any exchange rate between them. For these countries, the terms "nominal effective exchange rate" and "real effective exchange rate" have been replaced by the terms "**trade-weighted currency index**" and "**relative price and cost indicators**" but the underlying concepts and their calculation remains the same. The trade-weighted currency indices for individual countries using the euro may diverge because they have different trading patterns. In addition, the relative price and cost indicators may evolve differently due to diverging price and cost trends.

A comprehensive assessment of developments in cost and price competitiveness should ideally draw on various measures of the real effective exchange rate. Most international trade is in manufactured goods and some widely used measures focus on **unit labour costs in the manufacturing industry (ULCM)**. However, in-house labour costs account for only a limited share of total costs in the manufacturing industry. The sector purchases a growing amount of inputs from the rest of the economy, including financial services, marketing, accounting etc. In addition, an increasing amount of services are traded internationally. Therefore, some prefer to consider developments based on **unit labour costs in the whole economy (ULCE)**. Moreover, capital costs account for a sizeable fraction of total costs. Price measures such as the **GDP-deflator (PGDP)** include the return on capital. On the other hand, the measures based on ULCE and PGDP cover many sectors whose output is neither directly nor indirectly traded. The discussion in Part 1 focuses on real effective exchange rates as measured by unit labour costs in the whole economy, but Part 2 of the report also shows real exchange rates based on the deflator of private consumption, and the deflator of exports of goods and services (PX).

1994 is taken as the base period for the indicators of price and cost competitiveness. This does not imply that 1994 exchange rates should be treated as equilibrium rates.

The quarterly report is also available on the Internet. Our Web site, "http://www.europa.eu.int/comm/economy_finance/document/pccr/pccr_en.htm", permits the downloading of standard statistics to your PC or Macintosh. Moreover, differently defined nominal and real exchange rates are available upon request. A technical annex provides further details.

PART 1

DEVELOPMENTS IN
THE COST COMPETITIVENESS OF
THE EUROPEAN UNION,
THE UNITED STATES AND JAPAN

DEVELOPMENTS IN THE COST COMPETITIVENESS OF THE EUROPEAN UNION, THE UNITED STATES AND JAPAN

MAIN FEATURES

The euro against major international currencies:

- During the fourth quarter of 2000, the euro appreciated against the US dollar, the Japanese yen and the pound sterling, by respectively 3%, 8%, and 1%. In the same period, the Swiss franc appreciated by about 1%. In all, the nominal effective exchange of the euro appreciated by nearly 3% against the currencies of 13 industrialised countries.
- By the end of the fourth quarter, the nominal effective exchange rate of the euro has depreciated by about 13% since the changeover on 1 January 1999.

Relative cost and price indicators: international developments

- Together with subdued price and cost increases, exchange rate developments led to an additional gain in the cost competitiveness of euro area producers (against other industrialised countries) of about 2% in the fourth quarter of 2000, leading to a total gain of 17% since the launch of the euro.
- In a longer-term perspective, unit labour costs relative to EUR11 are 44.8% above their 1987-99 average in the United States and 37.8% above their 1987-99 average in Japan.

Relative cost and price indicators: intra-EMU developments

- Over the *last two years*, the Netherlands, Finland, Spain and Portugal saw a deterioration in cost competitiveness relative to EMU partners. In these countries, cost and price pressures are related to their strong cyclical position and, in some cases, to a catching-up process. In contrast, moderate wage increases or weaker cyclical positions lead to an improvement in intra-EMU cost competitiveness in France and Germany.
- In a *longer time perspective*, intra-EUR11 cost competitiveness is considerably better than its 1987-99 average in Finland (about 9%), while it is considerably worse than this average in Portugal (about 18%).

Relative cost and price indicators: Member States outside the euro area

- Denmark has seen a further deterioration in its unit labour cost competitiveness against the EUR11 over the last two years (about 3%) and relative to its 1987-99 average (about 9%). In Greece, cost competitiveness based on ULCM improved over the last year by about 2%, but relative unit labour costs are still 14% higher than their 1987-99 average.
- Because of the strengthening of the pound, unit labour costs in manufacturing in the UK remained some 52% higher than their 1987-99 average relative to EUR11. In Sweden, cost competitiveness worsened by about 10% relative to the euro area over the last two years.

PRICE AND COST COMPETITIVENESS

QUARTERLY REPORT - FOURTH QUARTER 2000

I. INTERNATIONAL DEVELOPMENTS

1. BILATERAL EXCHANGE RATES OF THE EURO

In 2000, the euro has been on a mostly depreciating trend against most major world currencies. (Chart 1 and 3). The fourth quarter of 2000 has witnessed two reversals of situation: in October, the euro reached an historical low, that have eventually triggered some interventions. Following these interventions, the euro started to recover quite sharply. This recovery is due to a revision of relative growth prospects in Japan and US vis-à-vis the euro area.

The **dollar/euro** exchange rate has attracted most attention in the past one and a half years. Having started at 1.17 dollar per euro at launch, the euro fell below 0.85 at the end of September. This level triggered the first joined intervention of the ECB and the G-7 Central Banks in support of the euro. However, the euro reached its lowest level on 26 October at 0.82 USD. This level corresponded to a decline of about 30% percent compared to January 1999. The ECB intervened again three times (3, 6 and 9 November), but this time unilaterally. The last intervention brought the euro up to 0.87 USD but it then slipped down again, until the beginning of the recent recovery that started at the end of November. At the end of December, the euro was 13% above its October trough. The euro hit a 5-month-high at 0.93 at the end of 2000, but was still 23% below its launch level.

The euro had experienced an even larger depreciation against the **Japanese yen** during the year 2000. From 134 yen per euro on 4 January 1999, the euro fell to a low of JPY 89 in October 2000. At this

Chart 1 The euro against USD and JPY since changeover
Index 1.1.1999 = 100
(daily data)

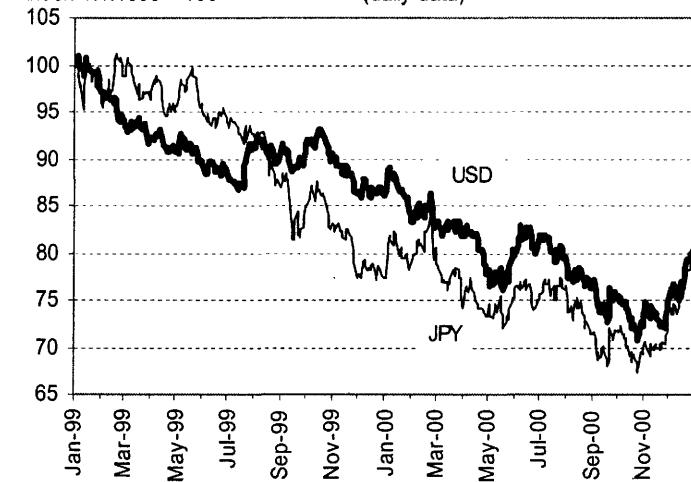

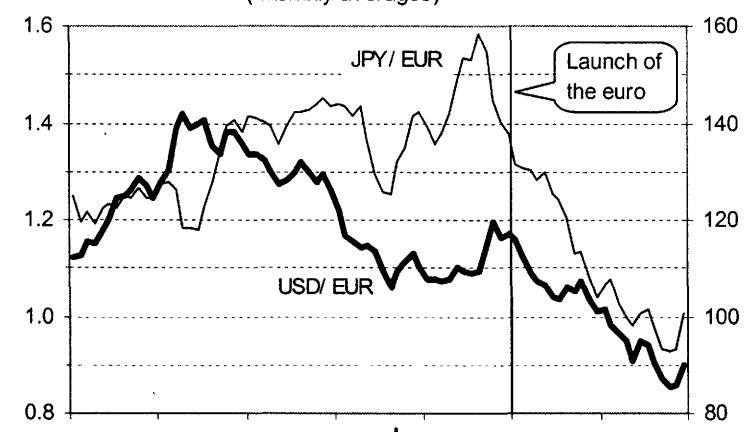

Chart 2 The euro (DM) against USD and JPY since 1994

(monthly averages)

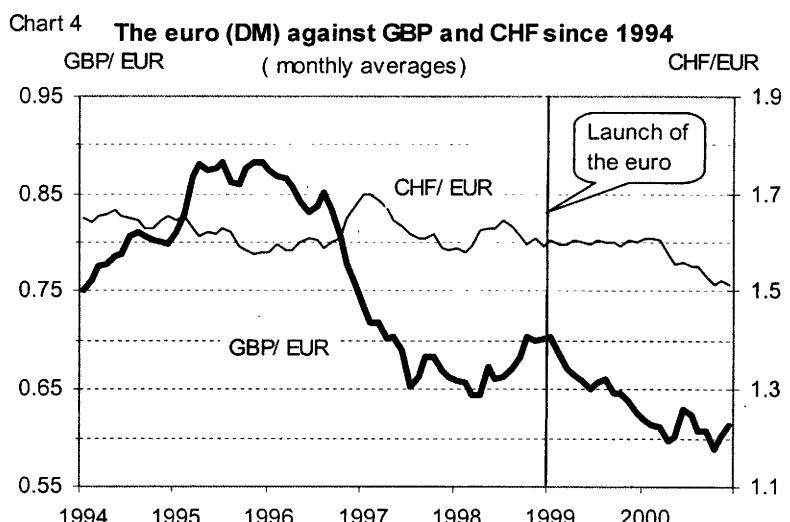

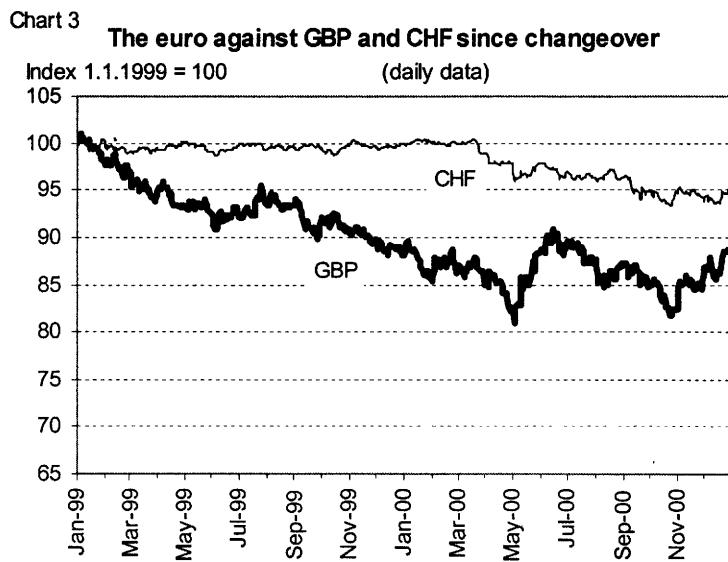

Note: EUR rates before 1999 calculated on the basis of DEM rates.
Source: European Commission

level, the euro was 33% down compared to its launch level. However, the recent recovery of the euro has been bigger vis-à-vis the Japanese yen than vis-à-vis the US dollar. At the end of December, the euro recovered by about 20% from its low in October. At 107 yen, the euro reached a 10-month high against the Japanese yen. Nevertheless, at the end of 2000, the euro still lost 23% against the Japanese yen compared to its launch level.

The **Pound Sterling** has been on an appreciating trend in 2000 against the euro, while it fell to a historical low against the US dollar. After a low in October, the euro started to gradually recover in December. However, at the end of 2000, the euro was still 19% below its launch level against the pound.

The *Swiss franc* also rose to a high against the euro in October 2000. At this level, the euro was 7% below its changeover level. However, the euro recovered only by about 2% compared to this low. Therefore, it is still about 6% below its January 1999 level.

Note: EUR rates before 1999 calculated on the basis of DEM rates.

CHF/EUR	1.531	1.514	-1.1%	1.544	1.516	-1.8%

Source: European Commission

2. NOMINAL EFFECTIVE EXCHANGE RATES (IC24)

Since its launch, the nominal effective exchange rate of the euro has depreciated significantly. The depreciation resulted from generalised downward movement vis-à-vis most main currencies. In October 2000, the nominal effective exchange rate of the *euro* area countries reached its 11-year-low level. However, part of this depreciation has been reversed by the recovery of the euro in December 2000 that led to an appreciation of 4% compared to the October level. Nevertheless, the nominal effective exchange rate of the euro is still 13% below its changeover level.

The nominal effective exchange rate of the *US dollar* reached its highest level ever in November 2000 (cf. chart 6). Since then, however, the recent depreciation of the dollar against the euro led to a gain of competitiveness. The competitiveness of the US economy improved only by 2% as the dollar strengthened vis-à-vis the yen.

The nominal effective exchange rate of the *Japanese yen* depreciated by about 6% in December 2000 compared to the high level of September 2000 that was very close to its peak in 1995.

The nominal effective exchange rate of the *Pound sterling* depreciated by 3% compared to April 1999 when it reached a 17-year-high. However, it is still high from an historical point of view.

TABLE 2: NOMINAL EFFECTIVE EXCHANGE RATES
(vs. 24 industrialised countries, index 1994 = 100)

	During the fourth quarter of 2000 (monthly averages)			Relative to the previous quarter (quarterly averages)		
	Average Sep-00	Average Dec-00	% change	Average Q3-00	Average Q4-00	% change
EUR11	92.5	95.0	2.6%	94.4	92.8	-1.8%

GBP	123.2	123.9	0.5%	123.7	125.0	1.1%

Source: European Commission

3. REAL EFFECTIVE EXCHANGE RATES (IC24) BASED ON ULCE

As a result of the depreciation of the euro and low price and cost inflation in the euro area compared to trading partners, the cost competitiveness of the *euro* area considerably improved in 2000. EUR11 reached its most favourable cost competitiveness level ever in October 2000 (cf. Chart 7). Since then, the euro's recovery of December 2000 led to a slight decrease (about 4%) of cost competitiveness of the euro area. However, at the end of 2000, the real effective exchange rate of the euro area was still 17% below the changeover level.

Over the last year, the strength of the *US dollar*, led to a deterioration in the cost competitiveness of the US economy. In November, the real effective exchange rate of the USD reached its highest level since 1986 (cf. Chart 8). However, recent developments of the dollar led to a slight amelioration of the cost competitiveness by about 3% compared to the last quarter. Nevertheless, the real effective exchange rate of the US has appreciated by 10% since the launch of the euro. From an historical point of view, it is very high as it stands 19% above its 1987-99 average.

Despite the depreciation of the *Japanese yen* by 8% against the euro during the fourth quarter, the real effective exchange rate of the Japanese yen is still about 11% higher than its 1987-99 average. Following the recent developments of the Japanese yen, the real effective exchange rate has depreciated by 6% since September.

Due to the high level of the *Pound Sterling*, the cost competitiveness of the UK has been very low over 2000 as the real effective exchange rate reached its all-time high in April 2000 at some 25% above its 1987-99 average.

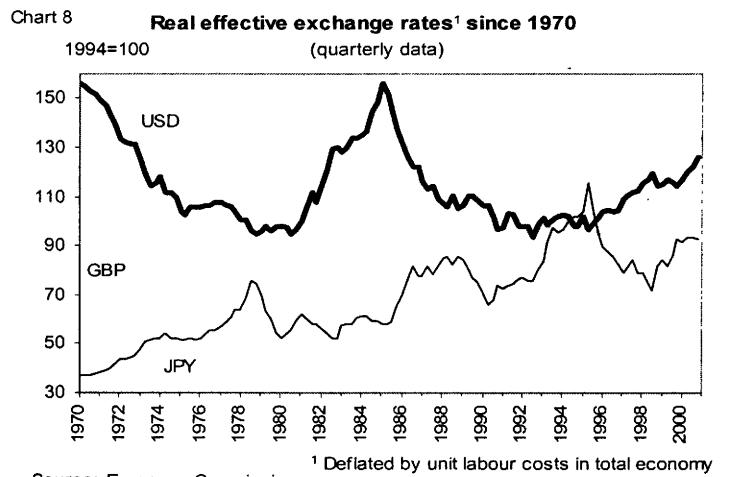

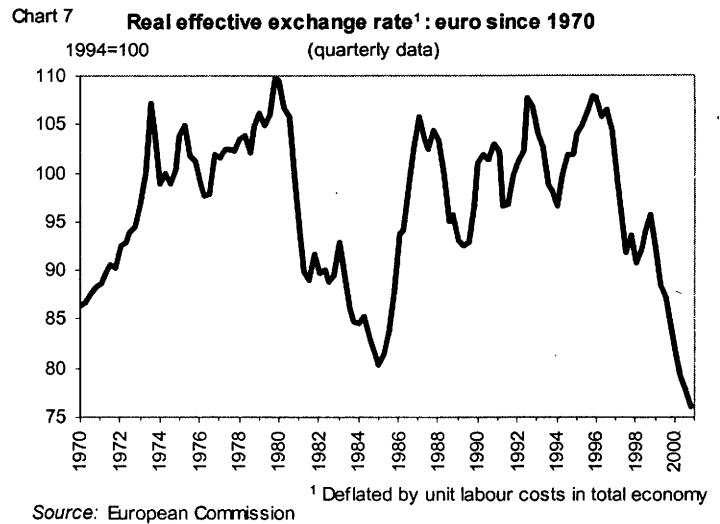

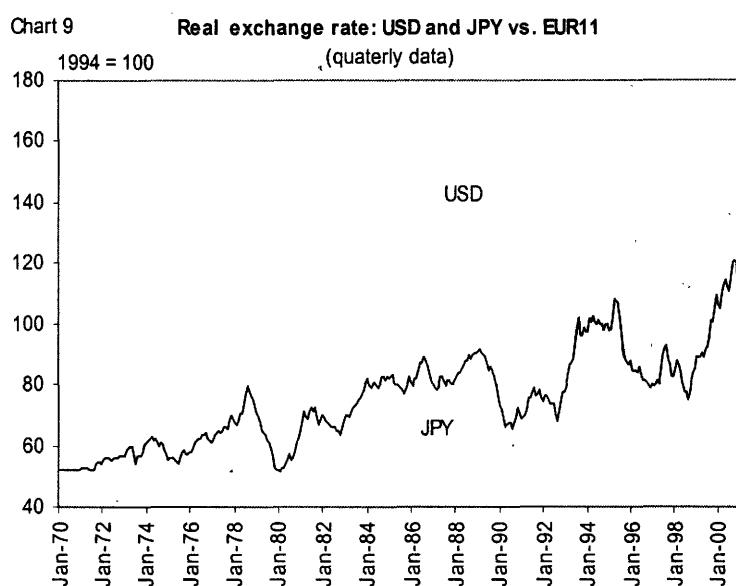

TABLE 3: REAL EXCHANGE RATES (ULCE)
(vs. 24 industrialised countries, index 1994 = 100)

	Relative to the previous quarter (quarterly data)			Rel. to the previous year (quarterly data)		Rel. to long-term average (quarterly data)

4. COST COMPETITIVENESS OF THE USA AND JAPAN RELATIVE TO THE EURO AREA

Since the launch of the euro, the strengthening of the US dollar against the euro led to a loss in cost competitiveness for US producers against their EUR11 competitors of around 33%. The real exchange rate of the US stands 45% above its long-term average (cf. chart 9). In a historical perspective, the unit labour cost position of euro area producers is currently very favourable relative to US producers, better than at any time since late 1985. However, the recent recovery of the euro against the US dollar led to a small improvement of 5% of the cost competitiveness of US producers.

The appreciation of the Japanese yen has contributed to a deterioration of 20% in cost competitiveness for Japanese competitors against EUR11 producers since the launch of the euro (and by 2% over the fourth quarter). Unit labour costs in Japan relative to EUR11 are almost 38% above their 1987-99 average. At this level, the cost competitiveness for EUR11 producers relative to Japan is at its most favourable level (cf. chart 9).

II. DEVELOPMENTS WITHIN THE EUROPEAN UNION

1. COST COMPETITIVENESS MOVEMENTS AMONG EURO AREA MEMBER STATES

Within the euro area, diverging movements in costs and prices may change the relative cost competitiveness positions of euro area Member States. Table 5 and Chart 10 show three measures of the real effective exchange rate of individual Member States against EUR11. The different measures do not always give a uniform picture of the movement over time in the real effective exchange rate of a given country against its partners and, as such, the indicators of cost and price competitiveness need to be interpreted carefully.

In some cases, deviating price and cost trends among euro area Member States could lead to a build-up of competitive imbalances which might ultimately hamper economic growth and cause unemployment in individual Member States. In other cases, however, longer-term changes in relative prices and costs may be justified by changes in economic fundamentals related e.g. to a catching-up in the level of economic development, changes in non-price competitiveness factors, or changes in underlying savings and investment patterns. Moreover, differences in cyclical positions may cause movements in relative costs and prices in the short term. An in-depth assessment of movements in real exchange rates therefore requires a comprehensive analysis of the economic situation in each country seen in a longer time perspective. This report merely provides a descriptive overview of movements in intra-euro area cost and price competitiveness indicators.

Recent developments

The price and cost competitiveness in Belgium, Luxembourg and Italy has been broadly constant over the last two years.

- ***Depreciation***

Over the last year, the relative cost competitiveness positions of **Germany**, **France** and **Austria** have improved against EUR11 (cf. table 5). While in France this reflects low cost pressures due to moderate wage pressure, in Germany low price pressure results from weaker cyclical conditions than for the average of the euro area. The Austrian position also improved, but to a lesser extent and it is still worse than its 87-99 average.

- ***Appreciation***

Over the same period, there was a deterioration in the cost competitiveness positions of **Spain**, **Portugal**, **Finland**, the **Netherlands** and **Ireland**. In all five countries, above-average cost and price increases are related to a strong cyclical position.

In **Ireland**, following rising wage and price pressures due to continued strong growth and an increasingly tight labour market, cost competitiveness indicators have deteriorated. On the contrary, the cost indicator based on manufacturing is still decreasing and stands 24% below its historical level. All in all, cost and price

competitiveness remain quite favourable (in a historical perspective), and the current account is still close to balance despite very strong domestic demand.

In the **Netherlands**, the upward movement of the real effective exchange rate should be viewed in the perspective of a sizeable real depreciation since the early 1980s and a large current account surplus despite strong domestic demand.

In **Spain** and **Portugal**, the appreciation of the real exchange rate may be warranted as the economies catch up with other euro countries. Nevertheless, the large current account deficit of Portugal may indicate an unwarranted loss in competitiveness.

TABLE 5: RELATIVE COST AND PRICE INDICATORS OF INDIVIDUAL COUNTRIES RELATIVE TO THE EURO AREA (EUR11)

UK	8.0	7.2	7.0	21.6	23.1	19.9	38.6	51.8	30.9

Note: relative ULCE and ULCM for Italy relative to any period before 1998 are distorted by the 1998 tax reform which shifted taxation from labour costs to value added but did not significantly change competitiveness.

- (1) ULCE = Based on unit labour costs in the economy as a whole.
- (2) ULCM = Based on unit labour costs in manufacturing industry.
- (3) PGDP = Based on GDP-deflator.

A minus means an improvement in cost competitiveness.

Source : European Commission

Relative to the 1987-99 period:

The large deviation from the 1987-99 average in the case of **Portugal** (rise of about 18% of the ULCE) could be partly related to the catching-up process that the country is undergoing. The real appreciation prior to 1992 may reflect a response to the opening of the economy upon accession to the European Community in 1986. Relative unit labour costs in the manufacturing sector – which produces tradables – have been broadly constant since 1992.

The current price and cost competitiveness of **Finland** is significantly better (about 9%) than its 87-99 average. This large deviation is related to the economic shocks that occurred in the late 1980s/early 1990s, including the collapse of trade with the former Soviet Union. As the process of raising the utilisation of the economy's productive

resources and reducing external debt makes progress, the real exchange rate relative to EMU partners may gradually appreciate in the medium term. However, in the second half of the 1990s, Finnish productivity picked-up leading to an improvement of competitiveness. Moreover, the Finnish economy is likely to be more exposed to the global and domestic growth of sectors associated with the “new economy”, and this may have consequences for the real exchange rate.

Ireland is unusual in that it has witnessed a trend depreciation in its ULC-based real exchange rate during the last decade of its catching-up process (cf. chart 10). To a large extent, significant productivity gains in the manufacturing sector have been achieved by (and in any case accompanied by) an increase in the capital-intensity of production related to the inflow of capital-intensive investment during the 1980s and 1990s. The substantial decline in the ULC-based indicators reflects a shift in the relative factor content of output rather than declining costs at the firm level or an exchange rate depreciation.

For the remaining countries, the measures of the relative cost competitiveness position show modest differences with the 1987-99 average (i.e. *Austria, BLEU*) or the various indicators convey conflicting messages with some measures above and some below their 1987-99 average.

2. COST COMPETITIVENESS BETWEEN THE EURO AREA AND OTHER MEMBER STATES

Denmark has seen a further deterioration in its unit labour cost competitiveness over the last two years (by about 3%), and the real effective exchange rate based on ULC in the manufacturing sector is some 15% higher than its 1987-99 average. This reflects both faster wage increases and lower productivity growth in Denmark than in the euro area in recent years.

After several years of real exchange rate appreciation, the devaluation of the **Greek drachma** upon its entry into the ERM in March 1998 resulted in a significant depreciation in real effective terms. However, due to the strength of the Greek drachma in the ERMII and higher price and cost increases, the real effective exchange rate of Greece against EUR11 has increased. Despite the amelioration of the Greek price and cost competitiveness over the last year, the Greek drachma, in real terms, is still well above its long-term average (+ 14% for ULCE).

Exchange rate developments have led to a further deterioration in the price and cost competitiveness of the **United Kingdom** relative to the euro area of about 22% (ULCE) over the last two years. ULC for the economy as a whole are 39% higher than their 1987-99 average and nearly 52% higher in the case of manufacturing industry.

In **Sweden**, cost and price competitiveness worsened by about 10% relative to the euro area over the last two years, mainly because the Swedish krona recovered on the back of a strong pick-up in the Swedish economy. In real effective terms, the krona is below its average over the 1987-99 period relative to the EUR11 for ULCM (-8%) and PGDP (-3%) and slightly above its long-term average for ULCE.

Chart 10 : Price and cost indicators for individual countries relative to EUR11

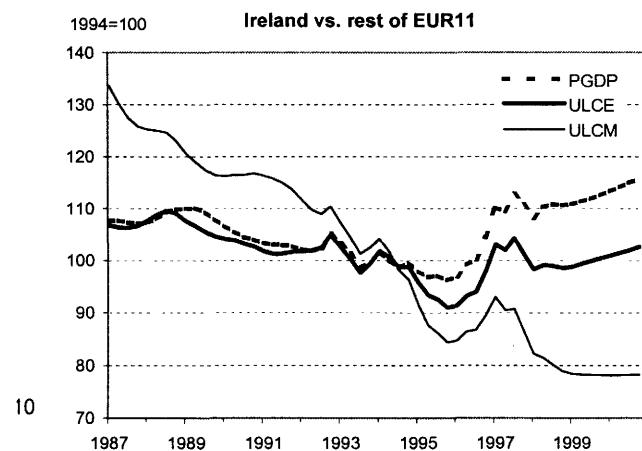

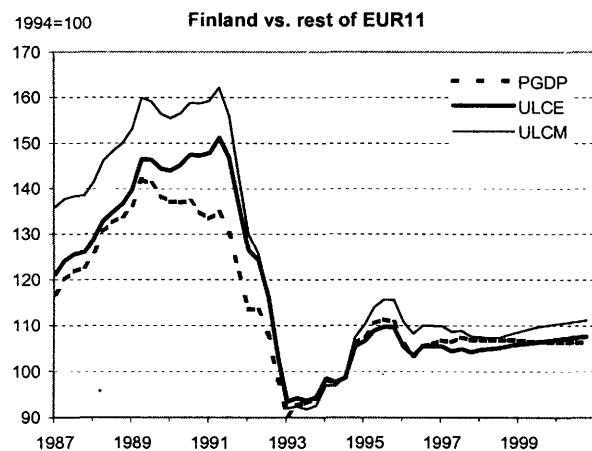

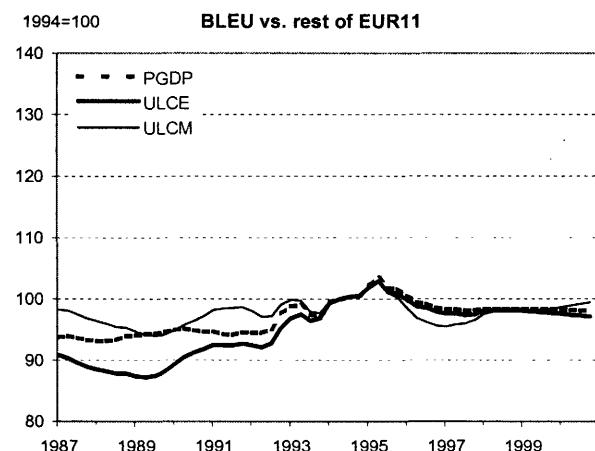

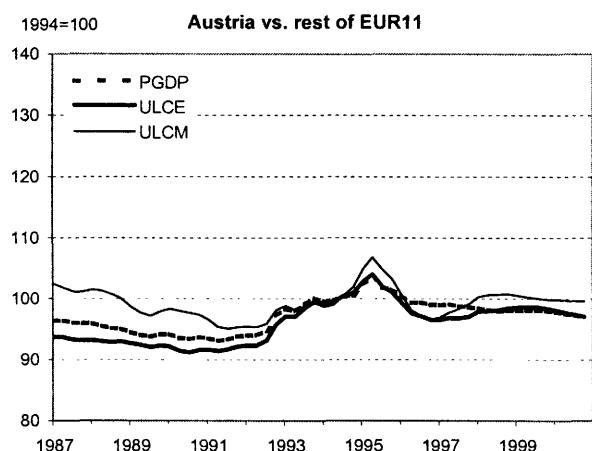

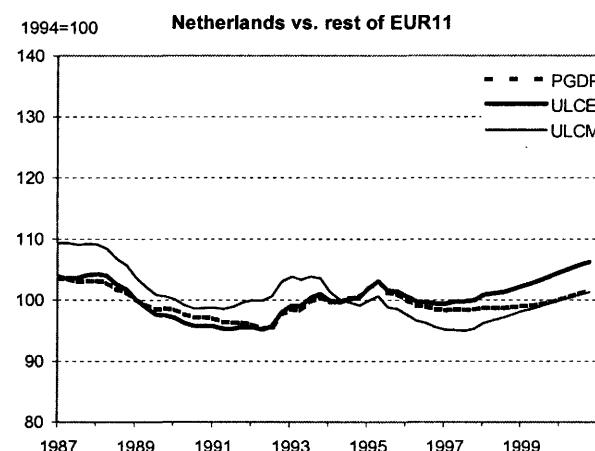

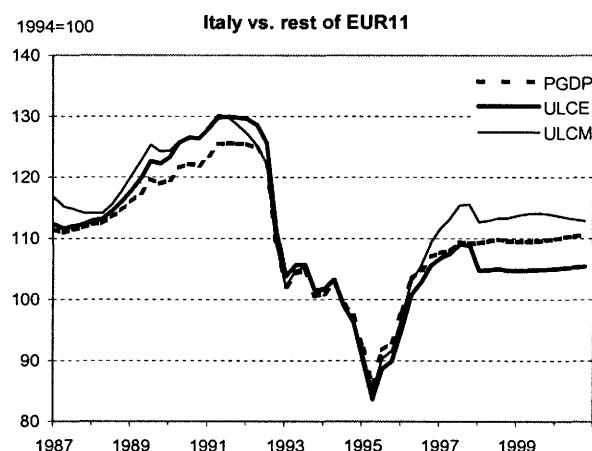

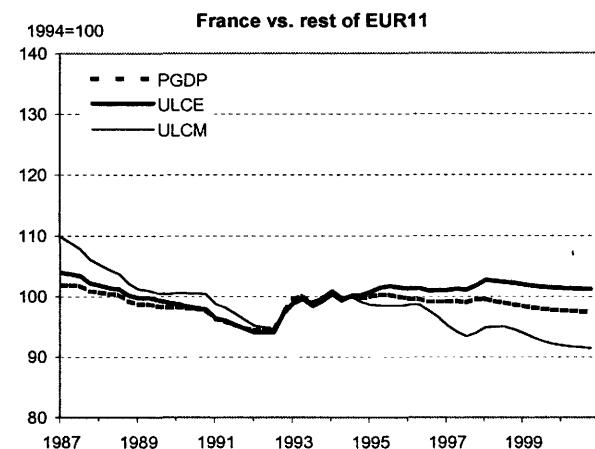

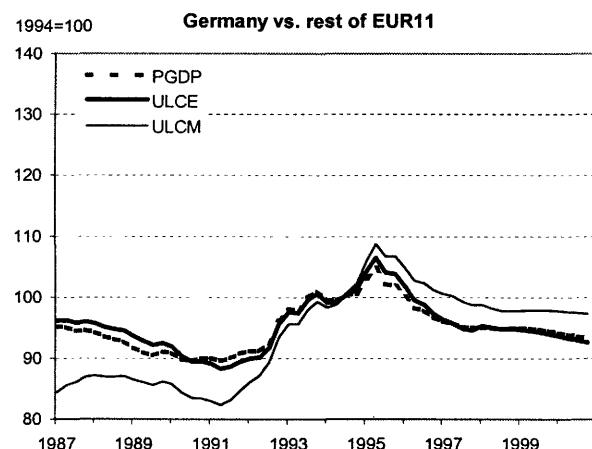

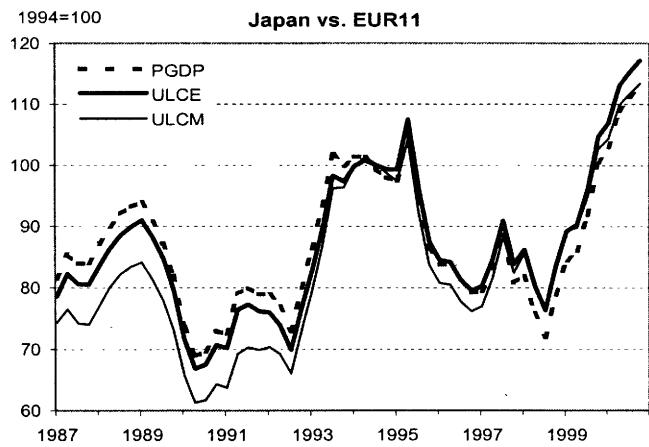

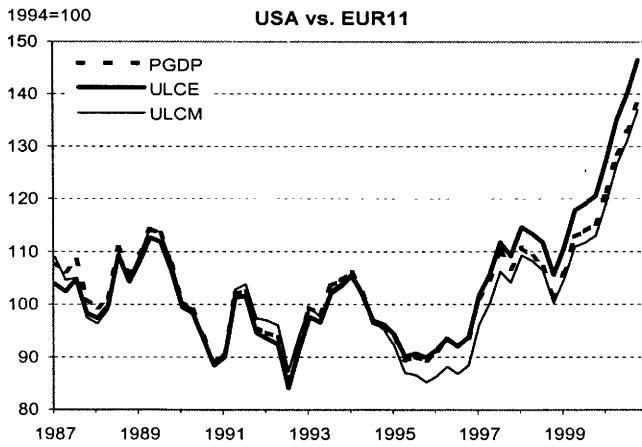

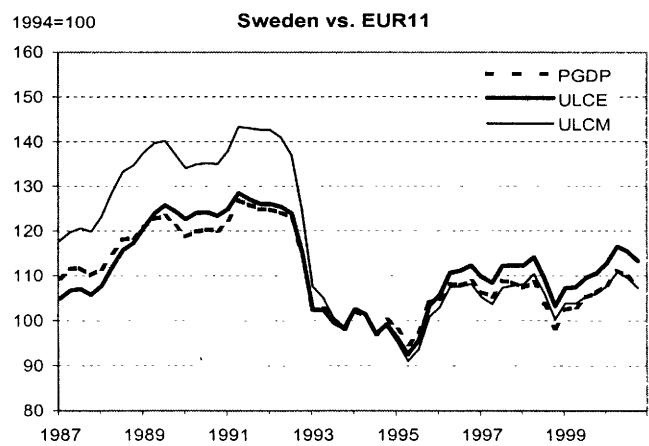

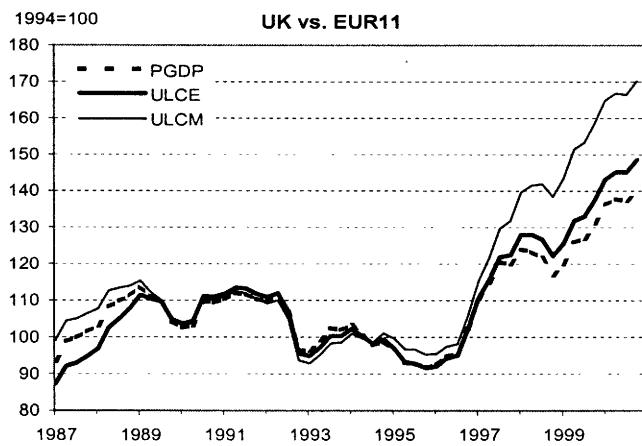

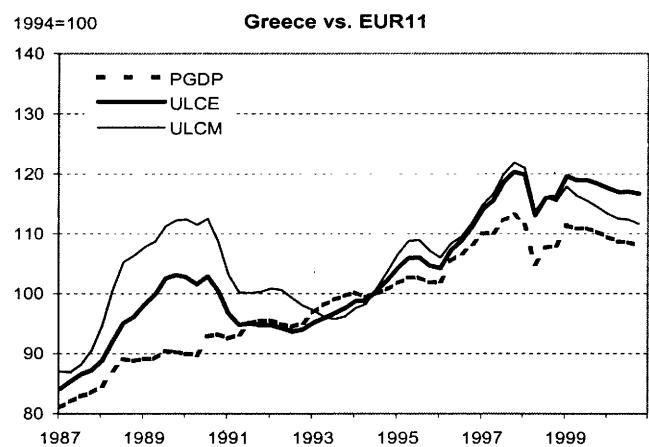

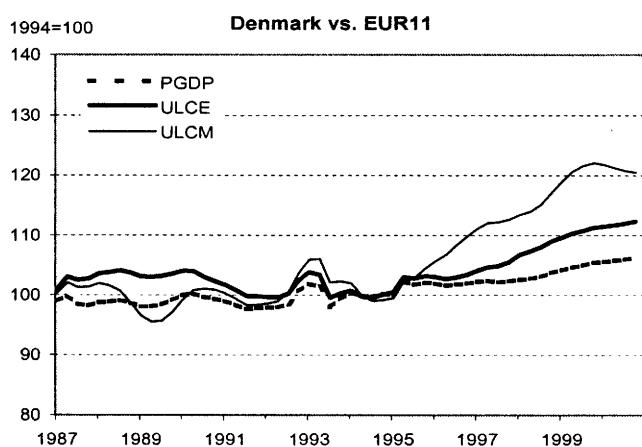

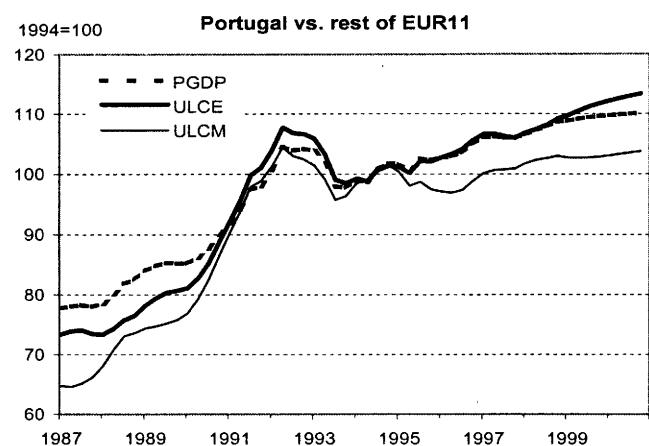

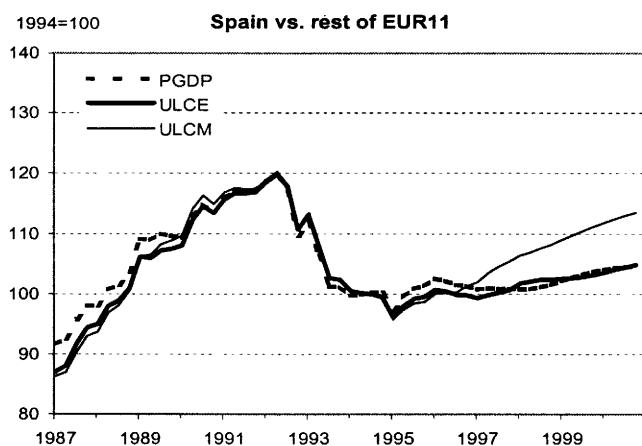

Chart 10 contd.: Price and cost indicators for individual countries relative to EUR11

PART 2

**TABLES AND GRAPHS
BY COUNTRY**

PART 2:

TABLES AND GRAPHS BY COUNTRY

The tables and graphs on **Pages 1 to 40** present nominal and real effective exchange rates of the currencies of the European Union Member States and five other industrial countries. Aggregate measures for the European Union as a whole (EU-15) and the group of countries participating in the Economic and Monetary Union (EUR11) are presented as well. Each country (or country group) is compared with 24 industrial countries (the 15 EU countries, Norway, Australia, Canada, Japan, the United States, Mexico, New Zealand, Turkey and Switzerland), with the European Union and with the group of ERM participants.

The tables on **Pages 41 to 51** present bilateral exchange rates of the US dollar against the currencies of the 24 industrial countries; and nominal and real effective exchange rates of the EU currencies, the US dollar and Japanese yen (as well as aggregate measures for EU-15 and EUR11). Each cross-national table of real effective exchange rates is based on a single price or cost deflator. Price and cost indices in national currency are presented as well. These tables aim to facilitate a comparison of developments in the different industrial countries. The final table shows the latest double export weight matrices that were used to calculate effective exchange rates.¹

TECHNICAL ANNEX

INTRODUCTION

The quarterly report on price and cost competitiveness presents recent changes in the nominal and real effective exchange rates of the euro area (EUR11), of the 15 individual EU Member States, as well as of the United States, Japan, Norway, Australia, and Canada (part 2). Aggregate measures for the European Union (EU-15) are presented as well.

The nominal effective exchange rate (NEER) (or, equivalently, the "Trade-weighted currency index") describes changes in the average value of a currency with reference to a given base period and a given group of reference countries. It is calculated as a weighted geometric average of the bilateral exchange rates against the currencies of competing countries. In this report, three alternative groups of competitor countries are considered: a group of 24 industrial countries (IC24), the 15 Member states of the European Union (EU-15) and the countries in the euro area (EUR11).

The real effective exchange rate (REER) (or, equivalently, the "Relative price and cost indicators") is calculated as the sum of the nominal rate and a trade-weighted price or cost deflator. The REER attempts to show the movement in the prices or costs of production of domestically produced goods relative to the prices or costs of goods produced by competitor countries, when expressed in a common currency.

Double export weights are used to calculate NEERs and REERs, reflecting not only competition in the home markets of the various competitors, but also competition in export markets elsewhere.

DG II's system for the calculation of effective exchange rates permits the user to make individual choices of competitor countries, reference period, method to calculate trade weights and, in the case of real effective exchange rates, price or cost deflators. This technical annex describes the standard measures used in this series of Quarterly Reports. Differently defined nominal and real exchange rates can be provided to interested persons or organisations upon request. Please fax your request to the European Commission, Directorate-General for Economic and Financial Affairs (DG ECFIN-C-1), fax n° +32-2-299.35.05.

METHOD

1. Choice of reference period

The choice of the reference period in assessing developments in nominal and real effective exchange rates is necessarily arbitrary and should not be seen as implying that exchange rates prevailing in this reference period were in equilibrium.

The reference year is 1994.

2. Calculation and application of trade weights (that transform the bilateral exchange rates into effective exchange rates)

The trade weights used are double export weights. This implies that the bilateral exchange rates between the currency of a given country and the currencies of its competitor countries are weighted according to both:

- (1) the competitors' share in the total supply of competing goods (including the supply by domestic producers) in each market separately; and
- (2) the relative share of each market in the total exports of the given country.

Moving weight matrices are used in order to capture the influence of changing trade patterns over time. The weight matrices of year t-1 are used to calculate the change in the effective exchange rate between the year t and t-1. If no weights are available for the year t-1, the weights of the latest year available are used.

3. Price and cost deflators (to transform the nominal effective exchange rates into real effective rates)

Five real effective exchange rates (each based on a different deflator) have been calculated in order to provide a comprehensive assessment of a country's price and cost competitiveness. The following deflators have been used:

- (1) the deflator of private consumption (PCP);
- (2) the GDP deflator (PGDP);
- (3) the price deflator of exports of goods and services (PX);
- (4) Unit Labour Costs in Economy as a whole (ULCE); and
- (5) Unit Labour Costs in Manufacturing (ULCM).

4. German unification

The data used in the quarterly reports on price and cost competitiveness have been adjusted¹ to reflect the shift in the average level of unit labour costs, thereby better capturing the deterioration in average German cost competitiveness associated with unification. An estimate had to be made for the level shift in unit labour costs in the manufacturing sector. On the basis of data for value-added and employment in the manufacturing sector in subsequent years the productivity gap was found to be smaller in this sector. Average unit labour costs in manufacturing have been adjusted by 1.3 per cent from 1991 onwards.

¹ For more details, see the box on German unification and cost competitiveness box published in the first quarter 2000 report

DATA SOURCES

1. Nominal bilateral exchange rates and deflators

Exchange rate data for the current year are the official daily rates recorded at 14.15 hours by the ECB. Monthly data are calculated as the arithmetic mean of the daily rates. Quarterly and yearly data are geometric means of these monthly figures. Historical data are provided by the IFS (IMF) database.

Annual data for the deflators (including Commission forecasts for the current year) come from DG ECFIN's AMECO database. As the calculation of real effective exchange rates requires a full data set, missing data have been estimated. The annual data have been transformed into quarterly data by applying a straight-forward spline method.

2. Weight matrices:

The moving double export weight matrices are derived from trade matrices with domestic production for the home market on the diagonal. The source of data on bilateral exports is the DoT (IMF) database. The source of data on domestic production (defined as GDP - exports) is national accounts' data from AMECO. Table H in Part 2 of the report reproduces the most recent weight matrices used in calculating effective exchange rates.

COUNTRY COVERAGE

1. Competitors

The report presents nominal and real effective exchange rates relative to a group of 24 industrial countries (IC24), relative to the European Union as a whole (EU-15) and relative to the countries in the euro area (EUR11). IC24 consists of the 15 EU Member States plus United States, Canada, Japan, Switzerland, Norway, Australia, New Zealand, Mexico, and Turkey.

2. Markets

Besides the countries considered as competitors, the following markets are distinguished: other Europe (including the Central and Eastern European Countries and the countries that used to be part of the USSR), other Asia/Oceania, other Western hemisphere, Africa, the Middle East and the rest of the World (including North Korea and Cuba). The conventions used in DoT/IFS (IMF) are followed strictly with two exceptions: (1) the industrial countries are not treated as a separate category; (2) the former East and West Germany are considered as a single entity: Germany.
