## **INFORMATION TECHNOLOGY: A STRATEGIC SECTOR OF THE EUROPEAN ECONOMY**

Information Technology (IT) is one of the fastest developing areas of industrial activity, with annual growth-rates in IT markets expected to continue at a high rate into the 1990s. It is not only a major industry in itself, but also contributes significantly to the operation of most economic sectors.

The convergence of IT with the increasingly deregulated telecommunications and broadcasting sectors is enabling an intangible product, information, to become one of the leading international commodities and a key element of the global economy. Furthermore, IT is rapidly becoming a driving force for social change, with far-reaching applications in such areas as education, health care and transport. Information technology is therefore of vital importance to Europe, both in renewing the competitiveness of established sectors and in the new opportunities it offers for a population rich in information-handling skills.

For Europe to make the most of these opportunities requires strategic action at the Community level. The Commission, in close consultation with national administrations throughout the EC, is providing both a framework, comprehensive enough for such strategic action, and the mechanisms and infrastructure for successful transnational cooperation. The blueprint for a revitalised European information technology community was established in the mid-1980s with the European Strategic Programme for Research and Development in Information Technology - ESPRIT.

## **ESPRIT - A STRATEGY FOR THE EUROPEAN INFORMATION TECHNOLOGY (IT) INDUSTRY**

### **Background**

Information Technology (IT) is one of the fastest developing and most significant areas of industrial activity. IT is a major industry in its own right, and has a major impact on competitiveness and employment in the economy as a whole. At the beginning of the 1980s European suppliers were in a weak position in several sectors, even to supply the European market, which represents a substantial segment of the global trade in IT; and the condition of the European IT industry in general was giving cause for concern, with decreasing market share leading to low levels of R&D and reduced capital investments.

To reverse this trend something substantial had to be done. It was generally recognised that concerted action at the European level was the only practical way forward: fragmented national markets were too small to provide the economies of scale required for effective competition, national companies could not expand sufficiently in their home market alone, and national policies were over-oriented towards national markets.

ESPRIT (European Strategic Programme for Research and Development in Information Technology) was defined after a thorough analysis undertaken in close consultation with industry in the early 1980s. Officially launched in 1984 as a 10-year programme divided into two 5-year phases, ESPRIT has the following three objectives:

- to provide European IT industry with the basic technologies needed to meet the competitive requirements of the 1990s
- to promote European industrial cooperation in IT
- to pave the way for standards.

### **ESPRIT I**

The total R&D effort of ESPRIT I, the first phase of the programme, amounted to 1500 million ECU, 50% of which was met from the Community budget, the other 50% by programme participants.

The programme, implemented by projects selected from public calls for proposals and based upon an annually updated work-plan, comprises collaborative precompetitive research and development projects, carried out across frontiers by Community companies, universities and research institutes. Under ESPRIT I, 226 projects were launched, each containing at least two independent industrial partners from different EC member states. 3000 engineers and scientists have

worked full-time on ESPRIT I projects, coming from 400 independent organisations. 130 of the 226 projects have provided a total of 166 major results. Of these, 42 have contributed directly to products or services currently available on the market; 48 have contributed directly to products or services being developed for the market but not yet commercially available; 46 are being used outside the ESPRIT project, either within the organisation concerned or in another organisation (technology transfer); another 30 have contributed to standardisation.

## **ESPRIT II**

The second phase of the ESPRIT programme was initiated in 1988, before the completion of ESPRIT I. It is a larger scale operation, but still preserves the mechanisms already established - the cost-sharing between Community and partners, the consensus-building, the work-plan and the on-going assessment principle. The total budget of ESPRIT II is 3200 million ECU, of which 50% is allocated from the research budget of the Community and which is estimated to represent about 5% of R&D expenditure in the IT industry. However, relative to the precompetitive part of R&D its share is much larger, and it has played an important catalytic role in stimulating the growth of total R&D investment.

The programme consists of projects and actions in the areas of:

- Microelectronics and Peripheral Technologies (MEL)
- Information Processing Systems (IPS), including software technology and advanced information processing
- IT applications technologies, including Office and Business Systems (OBS) and Computer-Integrated Manufacturing (CIM)
- Basic Research (BR), focusing on microelectronics, computer science, and artificial intelligence and cognitive science.

## **Project Synopses**

This volume, the first in a set of eight, contains introductions to each area of the programme and indexes to the projects and actions in both ESPRIT I and II. The other volumes in the set are:

- 2 Microelectronics (MEL)
- 3 Information Processing Systems (IPS) - ESPRIT I
- 4 Information Processing Systems (IPS) - ESPRIT II
- 5 Office and Business Systems (OBS)
- 6 Computer Integrated Manufacturing (CIM)
- 7 Information Exchange System (IES)
- 8 Basic Research Actions (BR).

They can be obtained from the address on page 181.

## **MICROELECTRONICS AND PERIPHERAL TECHNOLOGIES (MEL)**

### **INTRODUCTION**

In the first phase of ESPRIT, 49 projects were launched in the domain of microelectronics and peripheral technologies (MEL), and these are either already completed or near completion. In the second phase of ESPRIT, 30 projects have already been launched. The MEL synopses, in volume 2 of this set, provide a brief description of the objectives, the technical content and the updated state of advancement of each project. A list of partner names, a technical contact address, as well as the starting date and the duration, are also given.

### **General Overview**

The competitiveness of the European Community in all advanced areas of information technology depends on mastery of state-of-art semiconductor technology supported by computer-aided design (CAD) capability. The market for integrated circuits (ICs) is expected to approach 60 BECU by 1992 and some 20% to 30% of this will be for application-specific integrated circuits (ASICs) required by electronic systems producers to reach optimised solutions and protect proprietary architectures.

A very substantial part of the work performed within ESPRIT addresses the specific needs of this latter strategic sector. Other areas covered include Compound Semiconductor Devices and ICs, Optoelectronics, and Peripherals.

The ESPRIT projects listed in the MEL volume can, in very general terms, be classified under four sub-areas, according to the functionalities pursued:

- 1) High-Density Integrated Circuits
- 2) High-Speed Integrated Circuits
- 3) Multifunction Integrated Circuits
- 4) Peripheral Technologies.

Within each sub-area, individual projects address issues related to technology, CAD, manufacturing equipment and materials.

The key topics covered by each sub-area can be summarised as follows:

- 1) The High Density sub-area covers a number of linked topics: integration of design and production for the fast turn-around of prototype ASICs, advanced technology for chip fabrication, application-specific architecture compilation, CAD integration and standards, VLSI validation and test, and equipment for integrated circuit manufacture.

- 2) Advances in the High Speed sub-area are required (on Silicon Bipolar and/or GaAs technologies) for such IT application areas as telecommunications, mobile radio and computers. The topics addressed are packaging, CAD and process development, with the aim of establishing a European capability for systems applications where substantial improvements in speed and packing density are mandatory for penetration of world markets.
- 3) The topics covered by the Multifunction Integrated Circuits sub-area include non-volatile memory macrocells, mixed analogue-digital circuits, three-dimensional ICs, optoelectronics, and smart power technology. All require combining, on a single chip, design and process functions which would normally be developed and optimised independently. The ability to manufacture a multifunction IC therefore presents a significant challenge in the integration of different materials and design constraints to achieve costs and performances which are competitive to a multi-chip approach.
- 4) The Peripherals sub-area covers technologies where the potential business impact is seen to be greatest, building on existing strengths in Community IT industries. Included are high density magnetic mass storage, magneto-optical drives, large-area flat-panel displays and electro-thermal ribbon technologies.

## INFORMATION PROCESSING SYSTEMS (IPS)

### ESPRIT I

#### INTRODUCTION

Volume 3 of this set contains information on 94 projects supported both within the Software Technology and Advanced Information Processing areas of the first phase of the ESPRIT programme. The entry against each provides a summary of the objectives together with information on the progress made and results obtained. Further information can be obtained from the person indicated on the project sheet.

#### Software Technology

From its outset in 1984, the objective of this part of the ESPRIT programme has been to encourage the development of a scientific basis for software engineering from which a range of industrial practices can be designed and implemented.

The approach has been primarily one of viewing the software development process in the wider context of complex system development. This has ensured that the collaborative, precompetitive research and development actions of the ESPRIT programme have addressed the real problems faced by today's software industry in Europe, particularly the production of high quality software products and improving the productivity of the software development process.

To achieve these dual goals, the Software Technology programme has concentrated on four key subareas:

##### *(i) Theories, Methods and Tools*

The definition and development of rigorous design methods and the development of the appropriate support tools. The work covers formal methods (formal in the mathematical sense) and informal techniques, and the appropriate use of knowledge engineering techniques.

##### *(ii) Management and Industrial Aspects*

The development of techniques for project management and production management. The complexity of many software development projects is such that they require the coordination of large development teams, the production and revision of large amounts of documentation and code, the use of distributed computing facilities, etc. Appropriate techniques are therefore needed for resource management, documentation control, configuration management and version control.

### *(iii) Common Environment*

Clearly, the information which is generated during each phase of the development process needs to be stored in a relevant form, not only for easy access by the design team and the project managers, but also for the appropriate relationships to be maintained between the various design descriptions produced as the design proceeds. To provide the mechanism for this "object management", a common utility is necessary which provides the relational database mechanism and the relevant common interfaces for design tools, project management tools, user access, etc. This common environment provides the framework within which many of the results of the Software Technology programme can be integrated to form industrial systems. Within the subarea the first generation environment, based on the entity relationship model, has already produced common interface definitions which have entered the international standardisation process, and industrial systems are available. Next generation systems, eg incorporating knowledge engineering techniques, are under development.

### *(iv) Evaluation and Demonstration*

Proper evaluation of the environment, methods and tools within industrial contexts is crucial for the industrial take-up of results of the programme. Therefore, a number of projects have been launched to provide cost-benefit data on the use of these systems in industry.

## **Advanced Information Processing**

The objective of this part of the ESPRIT programme has been to develop the necessary technologies for the implementation of the next generation of computing systems, by supporting three main lines of action:

- the development and application of knowledge engineering techniques;
- the development of new computer architectures for symbolic and numeric processing, and fault-tolerant systems;
- the development of advanced system interfaces for effective communication between computing systems, the computer and its environment, and the computer and the user.

Priority has been given to consolidating and accelerating the industrialisation of the results emerging from the projects. Results have been achieved particularly in the knowledge engineering and computer architecture projects, where a firm base is being built for the future enhancement and exploitation of these technologies and techniques by European industry.

The Advanced Information Processing programme has concentrated on three key sub-areas:

*(i) Knowledge Engineering*

The development and application of knowledge-based systems. The approach adopted has been to:

- develop the methods and techniques for knowledge acquisition and knowledge representation;
- develop application-independent knowledge-based system shells, supporting languages and user interfaces;
- develop domain-specific systems;
- evaluate knowledge-based systems in the industrial environment.

*(ii) New Computer Architectures*

The development of high-performance computers capable of processing symbolic and numerical information, concentrating on highly parallel architecture machines.

Such computers will provide the computing capacity needed as the results of knowledge engineering work and advanced man-machine interfaces become embedded in a wide range of applications, eg CAD and office systems.

*(iii) Advanced Systems Interfaces*

The work has concentrated primarily on image processing, natural language understanding and speech processing, and is complemented by studies of multi-sensor operation.

## INFORMATION PROCESSING SYSTEMS (IPS)

### ESPRIT II

#### INTRODUCTION

Volume 4 of this set contains information on the 47 projects currently supported within the Information Processing Systems area of the second phase of the ESPRIT programme. The entry against each provides a summary of its objectives. In the main, these projects have commenced work over the period from late 1988 up to May 1989, and consequently it is too early to report on results. Further information can be obtained from the person indicated on the project sheet.

The Information Processing Systems sector is the result of merging two ESPRIT I areas, Software Technology and Advanced Information Processing. This merger is the result of the experience gained in the management of the ESPRIT I projects. It was also one of the recommendations from the mid-term review board. From a technical point of view, it has helped with the development of a global system approach: software developers, computer architects and knowledge-engineering experts are now working together.

The main objective of the Information Processing Systems (IPS) sector is to provide the industrial technology required for the development of the IT products likely to emerge onto the market in the 1990s. To support this objective, the programme of work defined within this sector is aimed at the management and control of system complexity, reducing development and operational costs, and improving the quality, reliability and performance of systems. Against this background, the drive towards systems engineering and a true systems approach to IT product development is gaining momentum.

In order to provide a manageable workprogramme and maintain a sensible continuity with ESPRIT I, IPS has been divided into five subareas (Systems Engineering, Knowledge Engineering, Advanced Systems Architectures, Human-Computer Interfaces and Sensor-Based Systems). However, it is clear that these are not wholly separate areas for R&D.

#### 1. Systems Engineering

European enterprises are now critically dependent on the quality and relevance of the IT systems that they develop. Increasingly, the emphasis of these systems has switched from one of cost reduction to one concerned primarily with competitive advantage or the provision of high quality services.

The advent of 1992 will bring with it new dimensions of opportunity and competition. The competitive advantages offered by the use of IT will, for most industrial and service sectors, be a major focus of concern. It is essential that Europe can continue to conceive, design and build the IT systems that support

the drive of its industry to fully exploit the opportunities offered in a single European market, post-1992, and for the supporters of this drive to win increasing shares of the global markets that they serve.

In such systems the software component is becoming the dominant cost element. At the beginning of the decade it accounted for approximately 45% of total costs; by the end it is estimated that this will have risen to just short of 80%.

However, if Europe is to derive the greatest benefit from its scarce resources in skilled manpower, there is a need to stimulate the take-up of industrial-quality methods and tools; to support the skills base needed to deploy these effectively; and to bridge the gap between the "state of the art" and "current practice". The emphasis in this subarea is, therefore, on two major themes: Systems Engineering Technology Development, and Technology Transfer and Consolidation.

## **2. Knowledge Engineering**

The speed at which European industry is able to fully utilise knowledge engineering technologies will have a significant impact on competitiveness in the 1990s and beyond.

The need for effective use of knowledge-based systems (KBS) in real-time environments is evident for many application domains. To date, work on KBS has reached the stage where the underlying principles of these systems are reasonably understood. Their role in decision support in non-time-critical areas has been established, and products are now emerging rapidly. The real-time domain, however, places very onerous demands on KBS and the underlying technologies - not least of which are speed of execution and speed of data retrieval. Within ESPRIT work has begun to address the major topics in this area, but it has now become necessary for European industry to launch the process of embedding real-time KBS into its next generation of products.

Emphasis is also put on the definition of more sophisticated development environments for KBS, addressing the issue of the next generation of expert system shells.

As the technology matures it will become more important to ensure rapid use of the results of the knowledge engineering programme. This will require experiments within a controlled industrial environment.

## **3. Advanced System Architectures**

System architecture affects all aspects of Information Technology and Information Processing. It influences and is influenced by all related areas, from functionality on silicon, through man-machine interfaces and human factors, to software. This topic is of primary importance because of its basic role for the efficient

implementation of IT systems, either in terms of execution speed or in terms of development cost.

The future performance requirements for computers will not be met simply by developing ever faster processing elements. There is, therefore, a continuing requirement for the efficient application of increased levels of computational concurrency, and this needs to be addressed both by the development of highly parallel and distributed processor architectures and operating systems, and by the availability of application software capable of effectively using the degree of concurrency offered by these machines.

#### **4. Human-Computer Interfaces**

A Human-Computer Interface (HCI) is a bridge between the human user and a (possibly very complex) technical computing system. HCIs need to match the requirements and capabilities of the user and enable the optimum use of the resources of the system. An HCI addresses not only the professional, but also, with increasing emphasis, the inexperienced user. In addition, a well-designed HCI has a high multiplier effect on the market penetration of products and services.

The ESPRIT subarea for HCIs encompasses Speech, Graphics and Hypermedia, Natural Language and Dialogue, and Interaction Principles.

#### **5. Sensor-Based Systems**

This part of the programme concerns the integration of sensors, signal processing, and understanding and control systems, into a unified architecture. Real-time capabilities are given a high priority. Modular approaches, both in hardware and software, are expected to lead to standardisation. Development tools that display powerful simulation facilities will be progressed.

#### **The IPS Projects**

The projects listed in Volume 4 are part of a developing portfolio that will increasingly reflect the more broadly based systems interests of the IPS sector while supporting the more detailed aims noted for each of the generic technology subareas identified above. In many cases, they will build on the results obtained so far in ESPRIT I projects and identified in volume 3. In all cases they will aim to establish an increased emphasis on "marketplace" and "industrialisation" issues.

## OFFICE AND BUSINESS SYSTEMS (OBS)

### INTRODUCTION

The world market for Office and Business systems (OBS) is estimated to be around 240 billion ECU by the early 1990s. More than one in three (36%) of white collar workers already use a personal computer or workstation, and this figure will rise to almost one in every two (45%) by 1991, and more than that (52%) by 1993. These machines will increasingly be networked. Local area networks are currently growing at around 20 to 25% per year, 20 to 50% of them will be interconnected within a few years, and there is increasing demand for high-bandwidth (2 Megabits per second) links to support workstation interconnection and services such as high-speed fax, remote database access, videoconferencing and videotelephony.

Improvements to the user interface, and standardisation at the applications level as well as at the lower levels, will facilitate use of these systems by a broader range of people for a broader range of functions, reducing the need for training, and improving end-user productivity.

The growth in office and business systems could more than double the productivity of management and other office workers by the end of the 1990s, and affect businesses and administrations accounting for more than 50% of the Gross Domestic Product in industrialised countries.

In addition, IT systems will increasingly find their way into the home, a market which represents some 110 million households in Europe alone.

Office and business systems, and the emerging applications in the home, represent a major route for the exploitation of R&D on basic technologies in the microelectronics, information processing, and other areas. In the world of the 1990s, they represent an essential bridge between the technologies and their application.

### Main Work in Hand

39 projects (about 3000 person-years of effort) are in hand under ESPRIT II, complementing the 48 projects launched under ESPRIT I. They are described in Volume 5 of this eight-volume set.

The overall strategic aim of the work currently in hand is to take advantage of emerging opportunities in office and business systems by facilitating the application of new technologies from the microelectronics, communications and information-processing domains. The work covers integrated office and business applications, as well as their underlying enabling technologies and communications environments. In addition, in recognition of the growing importance of systems designed for application in the home, work is currently

underway on the formulation of communications and control standards which will allow the development of multi-vendor and multi-applications products for private homes. The aim here is to facilitate the uptake of IT in consumer products and, in the longer term, to facilitate the emergence of "intelligent buildings".

The development of effective integrated office and business systems requires appropriate architectures and software tools, covering a wide range of domains and a broad range of functions from document handling through to decision support. Illustrative of this work is the development of the "Office Document Architecture (ODA)" (eg. Project 1024), which provides standards for the exchange of documents and which has been widely adopted by the IT industry within and beyond ESPRIT.

Successful integration of complex application systems into the day-to-day operation of a user organisation requires methodologies and tools which both enhance productivity and at the same time help to match the systems being developed to the real business needs of the organisation concerned. Work on these aspects of the problem is illustrated by the projects on an "Intelligent Business Support System" (IBASS) (Project 1573), on "Tools for Designing Office Systems (TODOS)" (Project 813), and, focusing on the needs of public administrations, on "Advanced and Integrated Office Systems Prototypes for European Public Administrations (ASTRA)" (Project 831).

In regard to specific technologies, a key point of focus has been the work on workstations and information servers. The workstation is playing an increasing role in office and business systems, and a concerted R&D effort is needed if the European IT industry is to gain ground on the lead taken by the US and the effort which is now being put into this area by Japan. Current work here is aimed at laying the foundations for later developments which can help to put the European IT industry into a competitive position. Work has focused on developing solutions to the problems of security, handling of multimedia documents, application of artificial intelligence, effective interfacing with the paper-based systems of current environments, design of the user interface, and other fundamental problems that need to be tackled before advanced workstations can be built. Projects such as MULTIWORKS (Project 2105), SPIRIT (Project 2484) and EWS (Project 2569), among others, are developing prototypes which will demonstrate many of the technologies that are needed. It will be important in the next stage of R&D to build upon this foundation work in order to help the industry move a step further towards a competitive position in this highly dynamic and increasingly important market sector.

With the rapid growth in the number of personal computers, and now with workstations and advanced information servers, organisations are increasingly interested in networking as a way of utilising these machines to maximum advantage, linking them into larger systems, and exploiting the possibilities they open up for resource-sharing, communications, and support of team-work at departmental, divisional and other organisational levels, including the support of enterprise-wide functions. The increasing loads put on business networks will

require higher bandwidth, such as can be achieved using optical technologies, and illustrated in the work on a "Local Integrated Optical Network (LION)" (Project 169). Organisations to date have concentrated on setting up relatively small networks for particular purposes, but are increasingly interested in linking these together, and building upon them to develop much larger networks supporting multi-media communication for a wider variety of business needs. The need for effective interworking between different networks covering a broad site is being addressed by work on a "Broad Site Local Wideband Communication System (BWN)" (Project 73).

Effective use of larger and more complex networks will increasingly depend upon distributed systems which can draw on the resources of different kinds of machines (eg. micros, minis, mainframes) as and when required. In such systems, a single application may make use of several different programs held on different machines, and data spread over yet further machines, different aspects of the work being done concurrently. Important progress in tackling this problem has been made in several projects, including the work on methods and tools for the "COnstruction and MANagement of Distributed Office Systems (COMANDOS)" (Project 834). This work has made contributions to the OSF (Open Software Foundation) Programme, to ISO (International Standards Organisation) standards, and to ODP (Open Distributed Processing) standards. It will be important for the next stage of R&D to build upon these achievements.

In the projects indicated above, and in the many other projects which have made complementary or supporting contributions, fundamental problems of applying the basic technologies involved to office and business applications have been tackled and important foundations have been laid for the next stage of R&D. This next stage must build upon the achievement so far, focusing in particular on integrating the results from different areas in order to help build more complete systems that can be applied to the needs of modern business and other enterprises.

### Priorities for Future Work

The next phase of R&D in Office and Business Systems needs to take account of the market and technological changes which have been occurring over the last five years, and to concentrate on those market and technology "hot spots" where focused R&D can have maximum effect. Three major areas of "hot spots" can be identified: workstations, communications and networks, and integrated applications.

The market for workstations is currently growing at around 60% per year (compared with less than 5% per year for mainframes, and similarly low growth for other mature market segments), making it one of the most significant areas of growth, and reflecting a restructuring of the computer market. The dynamic characteristic of this market comes from a combination of two main factors: users are demanding more, and technological developments (for example, in hardware

components and operating systems) are making it possible to deliver more at a competitive price. As a result, the traditional distinctions between personal computers, workstations, and minicomputers are breaking down as users are increasingly demanding from their desktop computers what was previously only associated with workstations, and as the workstations now coming on to the market start to take on many of the characteristics previously associated only with minicomputers. Significant changes have occurred over the last two or three years, and even more significant developments can be expected in the next generation.

Along with increasing power, more sophisticated user interfaces, and other developments to the stand-alone desktop machine, a second key trend has emerged: the movement away from stand-alone machines towards the use of machines which are networked together to provide communications within and between departments and other organisational entities, facilitating the sharing of resources on the networks and supporting concurrent distributed processing. This has put increasing pressure on conventional networks, and is encouraging the development of more sophisticated networks which are faster, have better security, and are significantly more advanced in other respects than the networks of today. Again, the pressure comes from user demands combined with technological developments (for example, in high-speed transmission media such as optical fibre) which make it possible to meet those demands in ways that are economically viable.

As interest in networking has developed, so there has been increasing awareness of the possibilities for using office and business systems to support not only the work of individual users, but of people working together in teams, including people who are currently mobile or who could become so given proper technological support. User organisations are increasingly demanding systems which can support the work of whole departments or divisions within an organisation, and to support functions which span the whole enterprise.

These three trends provide a framework within which the following priorities can be identified.

There is increasingly a need for a systems approach. In particular, workstations and communications need to be considered together as part of an overall networked system designed to support the working together of people and organisational units within an enterprise. Links to public networks providing communications between different enterprises, and between widely separated units within a single enterprise, need to be provided for.

There is a need for integration throughout the system. There needs to be increasing degrees of compatibility between applications software, operating system software, and the underlying hardware infrastructure, so that applications can run smoothly on different machines in different parts of an enterprise. There also needs to be increasing degrees of compatibility between the different components of the networks supporting the enterprise, so that information can be

easily transferred, processed on different machines, and printed as and when required from different printers. Mobile workers need to be integrated into the overall system so that they can access the resources of the network as easily as people working from fixed locations. It must be possible to "retrofit" new networks to existing systems without having to scrap the vast amounts of hardware and software in which many organisations have already invested, and it needs to be possible to allow a network to grow without major redesign.

There need to be international standards so that global enterprises and enterprises moving into new parts of the world can maintain a coherent and consistent approach to their office and business systems, without having to solve problems of incompatibility between different standards in different countries. Standardisation also facilitates the interworking of products from different vendors, allowing customers a choice of vendors. This is especially important in Europe, where there is a rich variety of vendors who in combination, but not individually, offer products across the whole range of user needs. Reliance on proprietary standards would mean that customers could not satisfy the whole range of their needs by using European products unless they were prepared to develop ad hoc solutions to the interworking and compatibility problems involved. Standardisation means that customers can "mix and match" products from different vendors according to their particular needs, confident that the products will work together smoothly as components in a higher-level system.

Against this background, the following specific topics are seen to be especially important.

R&D on workstations needs to focus on the three kinds of workstation which currently set the scene for the next generation. These are: at the high end, the technical and scientific workstation; at the low end, an entry-level workstation for use in the home and in education; and, in response to the increasing demand for technology to support mobile working, the mobile workstation, with its special requirements in terms of communications, ergonomics, and other aspects.

Work on communications and networks needs to look at the critical issues which are emerging in regard to speed, security and other factors in evolving networks, especially networks designed for large areas.

The successful integration of developments in these areas into integrated applications that can serve the business needs of enterprises requires R&D across a number of topics, including the development of architectures, methods and tools, as well as specific techniques and implementations. Work is needed at a number of levels, from support for cooperative teamwork in a distributed environment, through support for particular organisational functions such as data processing, through to support for enterprise-wide applications, and integrated applications in non-business contexts (especially the home).

## COMPUTER INTEGRATED MANUFACTURING (CIM)

### INTRODUCTION

The Computer Integrated Manufacturing (CIM) area relates to the total range of computer integrated manufacturing activities including computer-aided design (CAD), computer-aided engineering (CAE), computer-aided manufacturing (CAM), flexible machining and assembly systems, robotics, testing, and quality control. The area has been selected for its potential impact on the methods and economies of production, which are strongly geared to success specifically for the IT industries, and for manufacturing industry in general. The world market for CIM products was established as 37 BECU in 1987 and is expected to rise to 64 BECU in 1993.

The main objective of the CIM subprogramme of ESPRIT is to expand the Community share of the market for Computer Integrated Manufacturing to a dominant level in the European market and to achieve a significant penetration of non-EC markets. In addition it is expected that the CIM programme will help to accelerate the modernisation process in a wide range of industries, from discrete parts production to continuous processes, thus improving the competitiveness of the European manufacturing industry.

To work towards this objective, 39 projects have been launched under ESPRIT II to consolidate and extend the advances made by the 32 ongoing and completed CIM projects in ESPRIT I.

The synopses of ESPRIT CIM projects, contained in Volume 6 of this set, provide a brief description of the objectives, the technical content and the updated state of progress of each project. A list of partner names and a technical contact address, as well as the starting date and the duration, are also given. This volume provides an index of the synopses of projects (including those already terminated) listed in increasing project number order. A cross-reference list of projects identifiable by acronym is also provided.

### Overview of the CIM Programme

The ESPRIT strategy is based on three concurrent and interrelated lines of attack. These are:

- to identify integration paths based on open systems concepts and to develop the associated methods and tools
- to develop subsystems capable of exploitation within this framework
- to demonstrate the success of this approach and its benefits by early implementation in a wide range of production environments.

The joint involvement of both vendors and leading-edge users is fundamental to the success of the programme.

The work is divided into the following R&D topics:

#### **1. CIM Architecture and Communications**

The ESPRIT strategy is to pursue an approach to integration based on the concept of open systems interconnection (OSI), ie non-proprietary architectures based on the principle that components must be able to interconnect and interwork within a coherent, comprehensive and complete framework which is itself capable of supporting systems evolution. The resultant architectures and protocols, developed, validated and refined in ESPRIT, will be made progressively available to Community manufacturers and systems builders.

#### **2. Manufacturing Systems Design and Implementation**

There is a need for methods and tools which reduce the present high costs and long lead times for the design, implementation and optimisation of systems and subsystems, including batch and continuous process plants, factory layouts and shop floor control systems. The methods and tools to be developed should exploit recent advances in AI techniques which provide support to the system designer and increase the number of automatic design procedures available to him or her. The developments should also take into account the necessary verification steps for the design phases.

#### **3. Product Design and Analysis Systems**

The product design process is changing rapidly under the influence of IT and there is potential for adopting a new integrated approach to design in order to replace today's fragmented methods. The product model should be the nucleus of future design and analysis systems, and the model should be closely integrated with the main pre-production planning activities, thus eliminating redundancies between the design and production processes.

#### **4. Management and Control of Manufacturing Processes**

A unified approach to the control of production would bring considerable advantages to the flexibility and economics of manufacturing. Present systems do not achieve the required degree of integration, although significant advances have been made in ESPRIT, where work on cell and shop floor level control is already underway. Current work on an open system architecture will also support the development of unified systems.

## **5. Robotics and Shop Floor Systems**

The integration of robots and handling systems for materials, parts and tools is currently one of the major problems faced by both vendors and users and it lies on the critical path to achieving fully automated systems in most manufacturing domains. To realise fully the potential of robotic and other shop floor systems, further work towards integrated systems using developments within the overall architectural framework for CIM is required on the IT-based components of these systems. The restructuring of control algorithms and their implementation in specialised hardware is fundamental to success in this area.

## **INFRASTRUCTURE ACTION: INFORMATION EXCHANGE SYSTEM (IES)**

### **THE ESPRIT COMMUNICATIONS INFRASTRUCTURE - IES**

The Council decision on ESPRIT required that, in addition to the work defined in the main technical areas, supporting infrastructural actions be taken, particularly that an Information Exchange System (IES), be implemented to ensure that the execution and management of the research and development projects were properly supported and that appropriate dissemination was given to their results.

The general policy adopted hinges around the gradual development and availability of Open Systems Interconnection (OSI)-conformant computer communications products and is split into three parts :

- 1) The provision of services to the ESPRIT community.
- 2) Support for developments conforming to the International Standards Organisation (ISO) standards for OSI.
- 3) Harmonisation of standards implementations and other related Europe-wide research networking activities, in order to allow for interworking.

As part of the policy of supporting and accelerating migration to OSI, development activities were actively stimulated by the IES in order to provide OSI-conformant tools for IES users and service providers and to encourage the acceptance of OSI amongst European manufacturers. The overall objective was that in those areas where standards were sufficiently mature, products which would be of potential benefit to IES would be available in a time-frame allowing support to be given to other ESPRIT R&D projects.

The IES infrastructural actions, described in Volume 7 of this set, were also intended to supply working services to be used by the information technology R&D community. Within one month of the initial pilot projects starting (the first project began on 12 July 1983), ESPRIT had an operational electronic mail and conferencing system available called EuroKom, based on work under the European Cooperation in the field of Scientific and Technical research (COST) 11 programme. The system is used regularly by a significant proportion of the ESPRIT community and is growing rapidly as a means of:

- Projects communicating amongst themselves.
- Projects coordinating with the Commission of the European Communities.
- Dissemination of information about ESPRIT norms, standards, institutional news and conference calendars in many different fields.

## THE ESPRIT BASIC RESEARCH ACTIONS (BR)

### INTRODUCTION

There is a growing consensus that supporting basic research in Information Technology (IT) is a solid investment whose payback, even if it does not come in the form of short-term industrial applications, will be great. Such research, carried out at universities, research institutes and industrial research laboratories, serves the dual role of providing new knowledge and helping to ensure the future availability of high-calibre scientists and engineers. Both are key elements in the long-term ability of Europe to compete in global markets.

Research ideas conceived without thought to applications have often led to technological developments with major industrial, economic and social impact, and now provide essential tools for IT and all engineering areas that rely on a capability for rapid and massive computing and automated logical inference.

The importance of basic research is amply recognised in the USA and a recent Congress bill (aimed at "maintaining US supremacy in computer science") increases funding of basic research in computer science and high performance computing to a rate of about \$100M annually, in addition to an approximately equal sum provided by the US Department of Defence through DARPA.

Public funding of basic research in national programmes in Europe has shrunk in inverse proportion to the growing emphasis on industrially oriented research. In the light of this, the ESPRIT Basic Research Actions represent a modest effort to ensure that the reservoir of knowledge and skills needed for the continued health of industrial R&D will keep being replenished. The aim is to provide an opportunity for international collaboration at the European level and to enable research efforts, often inter-disciplinary, that would otherwise be too ambitious to undertake.

### BASIC RESEARCH IN ESPRIT II

The preparation of the ESPRIT Basic Research Actions started in 1987 through meetings attended by top European researchers representing a broad range of research interests. These contributed to a consensus on the range of areas to be covered and the cooperative schemes needed to carry out the work. The following objectives were established:

- to support collaborative fundamental research in selected IT areas
- to increase the involvement of leading research teams in ESPRIT.

It was agreed not to spread available resources too thinly over all possible areas of interesting, or even exciting, research; areas had to be selected. The main criteria used to select the areas that define the scope of the Basic Research Actions were established as:

- that they should have the potential to produce future breakthroughs or important advances even though they might not have any immediately visible applications
- that they should fall in areas where collaborative research on a European scale brings added value
- that they should be clearly upstream from main ESPRIT precompetitive R&D.

The first call for proposals was announced on March 25, 1988. By the closing date (13 June), about 300 proposals were received, requesting total funding of 485 MECU, and representing a research effort in excess of 1 BECU. They involved about 1400 participants from universities (74%), research establishments (20%), and industry (6%).

This response was much larger than had been anticipated. Furthermore, the proposals were generally of a very high quality and involved most European teams working in the forefront of basic IT research. The large number of proposals meant that only those of exceptional quality could be funded.

After evaluation by the Commission and recommendations by the ESPRIT Management Committee and by the ESPRIT Advisory Board, 61 proposals involving 285 different organizations were selected. In addition, 13 proposals were joined in working groups and given limited support to facilitate cooperation through travel and workshops. In total, a funding level of 63 MECU is expected to cover work over a 30-month period.

## **OVERVIEW OF LAUNCHED ACTIONS**

A brief description of the work launched in each of the three main areas follows, giving an indication of the actions launched in each.

### **Microelectronics (MEL)**

In the area of microelectronics, 26 actions and 2 working groups have been launched. Many different disciplines are needed to come together for the launched actions, including physics, organic, inorganic and physical chemistry, electronic engineering, material science, and metallurgy. Experimental, theoretical and integrated approaches are presented to tackle the long-term research needs. The main targets of the actions are:

*Low-Noise and High-Speed Devices* through the use of low temperatures, including fabrication and validation of low dimensional structures, and through new high  $T_c$  superconducting materials. The latter comprises studies of lattice dynamics, the influence of impurities, and the preparation and characterisation of films and single crystals.

*Fundamental In-Depth Studies of Structures* based on silicon III-V and II-VI compounds or other advanced substrates, exploring quantum effects or tailoring of electrical properties.

*Nanometre-Scaling of Circuits* amongst other fabrication techniques through realisation of organic molecule assemblages. The electrical properties of organics are under investigation. Carrier transport control and electronic switching capabilities are receiving major emphasis.

*Preparation of Superfast and Massively Parallel Computing Systems* developing optoelectronic elements and other related optical devices.

*Next-Generation Design Systems Development of Formal Methods and Algorithms*, covering formal verification, behavioural synthesis, real-time VLSI, architecture optimisation, and power timing optimisation.

## **Computer Science (CS)**

A total of 15 actions and 6 working groups have been launched. The actions provide a broad and coherent coverage of basic research in computer science and should provide results of wide applicability. A sub-area not sufficiently covered is that of architectures; this may reflect a gap in the computer science scene in Europe to be addressed in the near future.

*Formal Systems:* The two main components of the foundation of computer science, logic and algebra, are addressed, providing the framework for the development of specification and verification techniques and programming languages.

*Concurrent Systems:* The actions launched in this area investigate the relationships between competing schools and theories trying to provide an adequate framework for the description and analysis of concurrent systems. The aim is the unification of these theories (eg logics, languages, models) towards their application in specification and verification tools.

*Specification and Verification:* Actions cover the design of a specification language with the necessary system support, the use of logics as a foundation for specification techniques in concurrent systems, and ultimately a complex system, which is amenable to automatic verification and deals with multiprogramming and real-time.

*Algorithms and Integration of Programming Styles:* The efforts in this domain are focused on the definition of high-level declarative programming languages, and the challenge of integrating aspects of functional, logic and object-oriented programming is taken up.

*Dependability, Data Bases and Distributed Computing:* Actions cover the prototyping of an integrated systems architecture, and the software technology

to provide integrated database services and programming language capabilities. Concepts underlying design decisions and development techniques for assessing, predicting and validating dependability are dealt with in a unified manner.

### **Artificial Intelligence and Cognitive Science (AI/CGS)**

A total of 20 actions and 5 working groups have been launched. The actions are classified into sub-areas, but individual projects may span more than one of them and also have close connections with computer science and microelectronics.

*Robotics and Vision:* The issues of uncertainty, of representation of space and movement, and of adequate functioning in real-world domains are addressed by trying to understand the characteristics of systems that deal with natural environments.

*Neural Networks:* The actions deal with problems such as the development of suitable hardware (VLSI) implementations of neural networks and a deeper understanding of the relationship between classical AI and CS techniques and neural network techniques.

*Knowledge Representation:* Actions deal with computer-aided tutorial environments, uncertain reasoning, automated deduction in non-standard reasoning, and the building of a framework for a reflective system able to reason about its own competence and to apply its knowledge flexibly.

*Speech and Natural Language Processing:* Some actions address the ultimate goal of robust, speaker-independent recognition of continuous speech, exploring neural network techniques and natural speech production, while others address large multi-lingual knowledge bases, the integration of speech and natural language, and the handling of discourse.

*Formal Theories of Automated Manufacture:* The major need for a unification of the field's fragmented theoretical foundations is addressed, aimed at formalising a conceptual model of product design, production and production management.

*Human-Computer Interaction:* Actions cover computer modelling of users interacting with computers, cognitive modelling and investigation of user behaviour in the laboratory, and cognitive modelling of user behaviour in complex IT work domains.

## **CONCLUSIONS**

Volume 8 of this set contains a first description of the actions launched. The actions themselves, taken as a whole, provide a coherent coverage of the

intended areas, and a broad range of interdisciplinary links. They are carried out by teams of very high quality.

Looking into the future, the tasks set are to maintain dynamically the coverage of key areas, to reinforce interdisciplinary links which open new ways of looking at major problems, to ensure that the scarce qualified manpower needed for basic research is available, and to make certain that the results of research are transferred downstream to industrial research.

Concerning the latter aim, that of technology transfer, stronger links between industry and academia need to be established, and the form and suitability for transfer of Basic Research results must match the speed of their dissemination. To this end:

- A workshop will be held by each action once a year. Invitations to workshops will be issued to participants in other relevant Basic Research Actions as well as to other industrial researchers who could provide feedback on the suitability of results for addressing industrial problems.
- Some workshops will encompass activities of several actions in related areas. They will also act as focal points for the development of special training schemes on emerging topics where qualified research manpower is scarce.

The actual work in ESPRIT Basic Research Actions is just beginning. Time will have to pass before plans and hopes begin to be replaced by solid achievement. As a start, the actions described in this volume aim to provide a solid basis for the sustained effort that lies ahead.

## MASTER INDEX BY PROJECT NUMBER

Proj. No.	Title and Acronym	Vol.	Page
9	Exploitation of Real-Time Imaging for Arc Welding	CIM	5
10	High-Level CAD for Interactive Layout and Design	MEL	6
14	Advanced Interconnect for VLSI	MEL	8
26	Advanced Algorithms and Architectures for Speech and Image Processing (SIP)	IPS-I	5
28	A Multimedia Filing System (MULTOS)	OBS	7
32	A Basis for a Portable Common Tool Environment (PCTE)	IPS-I	8
33	Research Open Systems for Europe (ROSE)	IES	3
34	Design Rules for Computer Integrated Manufacturing Systems	CIM	7
43	Standardisation of Integrated LAN Services and Service Access Protocols (E-INTERFACE)	OBS	10
56	Functional Analysis of Office Requirements (FAOR)	OBS	12
59	New Information Models for Office Filing and Retrieval (MINSTREL)	OBS	4
64	Speech Interface at Office Workstation (SPIN)	OBS	16
73	Broad Site Local Wideband Communication System (BWN)	OBS	18
75	Design Rules for the Integration of Industrial Robots into CIM Systems	CIM	8
82	Intelligent Workstation (IWS)	OBS	20
92	A Computer Integrated Production Insula: Design Rules and Standards	CIM	9
96	Expert System Builder (ESB)	IPS-I	10
97	Advanced Algorithms, Architecture and Layout Techniques for VLSI Dedicated DSP Chips	MEL	10

107	A Logic-Oriented Approach to Knowledge and Data Bases Supporting Natural User Interaction (LOKI)	IPS-I	12
112	Knowledge Integration and Management Systems	IPS-I	14
118	General Purpose Sensory-Controlled Systems for Parts Production	CIM	10
121	Handling Mixed Text/Image/Voice Documents Based on a Standardised Office Document Architecture (HERODE)	OBS	23
125	Personal Workstation for Incremental Graphical Specification and Formal Implementation of Non-Sequential Systems (GRASPIN)	IPS-I	16
130	The UNIX-United Aspects of the IES	IES	5
131	Integrated Sensor-Based Robot System	CIM	11
169	Local Integrated Optical Network (LION)	OBS	25
179	Integrated Electronic Subsystems for Plant Automation	CIM	12
197	Computer-Aided Thermal Image Technique for Real-Time Inspection of Composite Material	CIM	14
231	Design and Operational Evaluation of Office Information Servers (DOEOIS)	OBS	27
232	Compound Semiconductor Materials and Integrated Circuits - I	MEL	14
234	Cognitive Simulator for User Interface Design	OBS	29
237	Communications Systems Architecture (CSA)	OBS	31
243	Submicron Bipolar Technology - I	MEL	16
244	High Yield and High Reliability ULSI System (HYETI)	MEL	18
245	SOI Materials and Processing: Towards 3D Integration	MEL	20
249	Ultra Wideband Optical Coherent Lan (UCOL)	OBS	33
255	CAD Methods for Analogue GaAs Monolithic ICs	MEL	22
256	Time Dependency and System Modelling in KBS Design for Industrial Process Applications	IPS-I	18
263	Integrated Optoelectronics on InP	MEL	24

266	Software Development Using Concurrently Executable Modules (PEACOCK)	IPS-I	20
267	Automated Support for Software Engineering Technology (ASSET)	IPS-I	22
271	Automatic Design Validation of Integrated Circuits Using E-Beam	MEL	26

1041	A General Environment for Formal Systems Development (GENESIS)	IPS-I	126
1043	Advanced Mask and Reticle Technology for VLSI Sub-Micron Microelectronics Devices	MEL	96
1051	Amorphous Silicon Contact Imager for Office and Graphic Applications	OBS	84
1056	Ultrasensitive Impurity Analysis for Semiconductor Structures and Materials	MEL	98
1057	Multipoint Interactive AudioVisual Communication (MIAC)	OBS	86
1058	Knowledge-Based Design Assistant for Modular VLSI Design	MEL	100
1059	Dynamically Adaptable Multi-Service Switch (DAMS)	OBS	87
1062	Computer-Aided Engineering Software For Advanced Workstations in the CIM Environment (ACCORD)	CIM	57

1063	Integration of Symbolic and Numeric Learning Techniques (INSTIL)	IPS-I 128
1072	Development and Integration of Accurate Operations in Numerical Data Processing (DIAMOND)	IPS-I 130
1074	Shipboard Installation of Knowledge-Based Systems (KBS-SHIP)	IPS-I 132
1085	Development and Application of Low-Cost, High-Performance, Multiprocessor Machine (SUPERNODE)	IPS-I 134
1094	Support System for Pragmatic reuse of Software Concepts (PRACTITIONER)	IPS-I 136
1098	A Methodology for the Development of Knowledge-Based Systems (KADS)	IPS-I 138
1106	Further Development of Prolog and Its Validation by KBS in Technical Areas	IPS-I 140
1117	Knowledge-Based User-Friendly System for the Utilisation of Information Bases (KIWI)	IPS-I 142
1128	Large-Diameter Semi-Insulating GaAs Substrates Suitable for LSI Circuits	MEL 102
1133	Advanced Model for Integration of DB and KB Management Systems (ISIDE)	IPS-I 144
1136	Distributed Automated System for Inspection and Quality Control (DASICQ)	CIM 59
1158	Advanced Techniques Integration into Efficient Scientific Application Software (ATES)	IPS-I 146
1199	Human-Centred CIM System	CIM 60
1252	A Multi-Method Approach for Developing Universal Specifications (AMADEUS)	IPS-I 148
1256	Dynamic Software Migration between Cooperating Environments (CHAMELEON)	IPS-I 150
1257	Software Quality and Reliability Metrics for Selected Domains: Safety Management and Clerical Systems (MUSE)	IPS-I 152
1258	Testing and Consequent Reliability Estimation for Real-Time Embedded Software (TRUST)	IPS-I 154

1261	Host-Target Development System (HTDS)	IPS-I	156
1262	Software Factory Integration and Experimentation (SFINX)	IPS-I	158
1265	SEDOs ESTELLE Demonstrator (SEDOs DEMO)	IPS-I	160
1270	Advanced Processing Technology for GaAs Modulation Doped Transistors and Lasers	MEL	104
1271	SETL Experimentation and Demonstrator (SED)	IPS-I	162
1277	PCTE Portability (SAPPHIRE)	IPS-I	164
1282	PCTE and VMS Environment (PAVE)	IPS-I	166
1283	VDM Interfaces for PCTE (VIP)	IPS-I	168
1520	Advanced Software Engineering Environment Logistics Framework/Accueil de Logiciel Futur (ALF)	IPS-I	170
1527	Software Productivity Evaluation Model (SPEM)	IPS-I	172
1532	A Preliminary Study Of A Vector Processing-Oriented Parallel Architecture	IPS-I	174
1533	Multilingual Information System (MIS)	OBS	88
1535	A PCTE Host-Target Distributed Testing Environment (APHRODITE)	IPS-I	176
1541	MultiLingual Speech Input-Output Assessment, Methodology & Standardisation	OBS	90
1542	Intelligent Documents Production Demonstrator (INDOC)	IPS-I	178
1550	Distribution and Reusability of Ada Real-Time Applications through Graceful and On-Line Operations (DRAGON)	IPS-I	180
1551	Advanced Manufacturing System (AMS)	MEL	106
1556	Visualisation Standard Tools in Manufacturing Industry (VITAMIN)	CIM	62
1558	Efficient Qualitative and Quantitative Use of Knowledge-Based Systems in Financial Management (EQUUS)	IPS-I	182

1560	Signal and Knowledge Integration with Decisional Control for Multi-Sensory Systems (SKIDS)	IPS-I	184
1561	A High Performance Flexible Manufacturing System Robot with Dynamic Compensation (SACODY)	CIM	64
1563	Automatic Control of an ASIC Fabrication Sequence (ACAFS) as Demonstrated in the Plasma Etch Area	MEL	108
1570	Application of Expert Systems to Industrial Chemical Analysis (ESCA)	IPS-I	187
1572	Basic Technologies for High Performance Solid State Image Sensors	CIM	66
1573	Intelligent Business Application Support System (IBASS)	OBS	92
1588	Parallel Computer Systems for Integrated Numeric and Symbolic Processing (SPAN)	IPS-I	189
1592	Therapy Adviser for Oncology (TAO)	IPS-I	191
1598	Reply and Evaluation of Software Development Plans Using Higher-Order Meta Systems (REPLAY)	IPS-I	193
1609	System Measurement and Architectures Techniques (SMART)	IPS-I	195
1613	Evaluation of an Intelligent Tutoring System Shell for Industrial and Office Training (ITS)	IPS-I	197
1653	Intelligent Process Control by Means of Expert Systems (IPCES)	CIM	68
2001	Storage, Processing and Retrieval of Information in a Technical Environment (SPRITE)	OBS	95
2010	Neutral Product Definition Database for Large Multifunctional Systems (NEUTRABAS)	CIM	71
2013	Development of European Magneto-Optical Drives	MEL	112
2016	Bipolar Advanced Silicon for Europe (BASE) - TIP	MEL	114
2017	Automated Process and Assembly Inspection by 3D Vision	CIM	73
2025	European Declarative System (EDS)	IPS-II	5

2032	CIM Implementation Addressing Levels of Integration in Various Environments (CIM ALIVE)	CIM	75
2035	Advanced GaInAs-Based Devices for High-Speed Integrated Circuits	MEL	116
2039	Advanced PROM Building Blocks (APBB) - TIP	MEL	118
2043	Mobile Autonomous Robot in an Industrial Environment (MARIE)	CIM	76
2046	Metrication and Resource Modelling Aid (MERMAID)	IPS-II	8
2048	Deep UV Lithography	MEL	120
2054	Ultra-Wideband Coherent Optical Lan (UCOL)	OBS	97
2058	Intelligent Communication Interface (ICI)	OBS	100
2059	Neurocomputing (PYGMALION)	IPS-II	10
2071	Construction and Management of Distributed Open Systems (COMANDOS)	OBS	102
2072	[See project number 887]	MEL	72
2075	Advanced Packaging for High Performance (APACHIP)	MEL	122
2080	Reconfigurable and Extensible Parallel and Distributed Systems (REX)	IPS-II	12
2082	Harmonised European Concepts and Tools for Organisational Information Systems (HECTOR)	OBS	104
2083	Structured Information Management, Processing and Retrieval (SIMPR)	OBS	106
2090	Early Process Design Integrated with Controls (EPIC)	CIM	78
2091	Vision Based On-Line Inspection of Manufactured Parts (VIMP)	CIM	80
2092	Application of Neural Networks for Industry in Europe (ANNIE)	IPS-II	14
2094	Integration and Design of Speech Understanding Interfaces (SUNSTAR)	IPS-II	16
2100	Metropolitan Area Communication System (MAX)	OBS	109

2101	Adverse-Environment Recognition of Speech (ARS)	IPS-II	18
2102	Standard for Coding of Moving Images on Digital Storage Media (COMIS)	OBS	111
2103	Multi-Environment Advanced System for Colour Treatment (MASCOT)	OBS	113
2104	Multi-Language Speech-to-Text and Text-to-Speech System (POLYGLOT)	IPS-II	21
2105	Multiworks (MULTIWORKS)	OBS	115
2109	Telematic Object-Oriented Tools for Services Interfaces (TOOTSI)	OBS	118
2111	Planning of Non-specific Transportation by an Intelligent Fleet Expert (PONTIFEX)	OBS	120
2114	Large Size Visual Interface Design for Multimedia Workstation Terminals (LSVI)	OBS	122
2121	Integrated Toolkit for Highly Advanced Computer Applications (ITHACA)	OBS	125
2125	Electro-Thermal Ribbon (ETR)	MEL	124
2127	Holographic Labelling Techniques for Automatic Identification in CIM Environments (HIDCIM)	CIM	82
2143	An Integrated Modelling Support Environment (IMSE)	IPS-II	23
2144	Information Technology Uptake Support Environment (IT-USE)	OBS	127
2146	Dynamically Adaptable Multiservice System (DAMS)	OBS	129
2148	Validation Methods and Tools for Knowledge-Based Systems (VALID)	IPS-II	25
2151	Software Certification on Program in Europe (SCOPE)	IPS-II	27
2152	Visual Inspection and Evaluation of Wide-Area Scenes (VIEWS)	IPS-II	29
2154	Machine Learning Toolbox (MLT)	IPS-II	31
2163	Shipboard Installation of Knowledge-Based Systems Design and Installation (KBS-SHIP)	IPS-II	33

2165	Integrated Modelling of Products and Processes Using Advanced Computer Technologies (IMPPACT)	CIM	84
2167	An Intelligent Real-Time System for Signal Understanding (AITRAS)	IPS-II	35
2170	A Set of Software Tools for a Document Workstation (SUPERDOC)	OBS	131
2172	Distributed Intelligent Actuators and Sensors (DIAS)	CIM	86
2177	Generation of Interactive Programming Environments II (GIPE II)	IPS-II	37
2178	Revision Advisor - An Integrated Quality Support Environment (RA-IQSE)	CIM	88
2189	Building Industry Project Management System (BIPMS)	CIM	90
2192	Advanced Intelligent Multisensor System for Control of Boilers and Furnaces (AIMBURN)	CIM	92
2193	Analogue/Digital CMOS ICs (ADCIS)	MEL	126
2195	CAD Geometry Data Exchange (CADEX)	CIM	94
2197	Process Modelling and Device Optimisation for Submicron Technologies (STORM)	MEL	128
2198	Factory Customer Premises Network (FCPN)	CIM	96
2202	CIM System Planning Toolbox (CIM-PLATO)	CIM	98
2218	Speech Understanding and Dialogue (SUNDIAL)	IPS-II	39
2221	Reseau d'Information et de Communication Hospitalier European (RICHE)	OBS	133
2239	Self-Service Facilities Architecture (SESEFA)	OBS	135
2252	Definition and Design of an Open Dependable Distributed System Architecture (DELTA-4)	IPS-II	41
2255	Tools for Processing Multi-Sensorial Signals for Plant Monitoring and Control (TOPMUSS)	IPS-II	43
2256	Architecture for Cooperative Heterogeneous Online Systems (ARCHON)	IPS-II	45

2260	Interactive Silicon Compilation for High-Performance Integrated Systems (SPRITE)	MEL 130
2265	Dry Develop Optical Lithography for ULSI (DRYDEL)	MEL 132
2267	Integrated Systems Architecture (ISA)	OBS 138
2268	Combined Analogue/Digital Integration (CANDI)	MEL 134
2270	Integrated Design and Production System (IDPS) - TIP	MEL 136
2272	Technological Feasibility of High-Voltage Smart Power ICs for Lighting Applications	MEL 138
2277	CIM For Multi-Supplier Operations (CMSO)	CIM 100
2280	Large Manipulators for CIM (LAMA)	CIM 102
2281	High-Tc Superconducting Thin Films and Tunnel Junction Devices (UNITED)	MEL 140
2283	Active Matrix Liquid Crystal Displays for TV and Office Systems	MEL 142
2284	Optoelectronics with Active Organic Molecules	MEL 144
2288	New Architectures for Optical Processing in Industrial Applications (NAOPIA)	IPS-II 47
2289	Optical Interconnections for VLSI and Electronic Systems (OLIVES)	MEL 146
2292	Testing Technology for Communication Network for Manufacturing Applications (TT-CNMA)	CIM 104
2294	Tools for Object-Based Integrated Administrative Systems (TOBIASI)	OBS 141
2301	The Development of a Methodology for Specifying Non-Functional Requirements (ORDIT)	IPS-II 49
2304	Lotosphere (LOTOSPHERE)	IPS-II 51
2315	Translator's Workbench (TWB)	OBS 143
2316	Multi-Sensor Image Processing (MUSIP)	IPS-II 53
2318	European Vanguard Efforts on Research and Engineering of Systems for Testing (EVEREST)	MEL 148

2319	ASIC Multichamber Rapid Thermal Processing with Microwave Enhancement	MEL	150
2322	IT Support for Emergency Management (ISEM)	OBS	145
2331	Advanced Distributed Environment for Production Technology (ADEPT)	CIM	106
2338	Integrated Manufacturing Planning and Control System (IMPACS)	CIM	108
2349	Fault-Tolerant Control and Management of Production Systems	CIM	110
2354	Demonstration of Advanced Reliability Techniques for Safety-Related Computer Systems (DARTS)	IPS-II	55
2360	Development of Ferroelectric Liquid Crystal Devices for Information Technology Applications (FELICITA)	MEL	152
2374	Piloting of the Office Document Architecture (PODA-2)	OBS	148
2382	Elusive Office (ELO)	OBS	150
2384	Metrics Education Toolkit (METKIT)	IPS-II	57
2394	Application-Specific Architecture Compilation (ASAC)	MEL	154
2397	Process Operators Multimedia Intelligent Support Environment (PROMISE)	IPS-II	59
2403	Development of a Multi-Chamber Batch Reactor for the Production of Multilayer Interpoly Dielectrics	MEL	156
2404	Primary Rate ISDN OSI Office Facilities (PROOF)	OBS	152
2409	Environment for Qualitative Temporal Reasoning (EQUATOR)	IPS-II	61
2415	Distributed Manufacturing Planning and Control	CIM	112
2424	Advanced Knowledge-Based Environments for Database Systems (KIWIS)	IPS-II	63
2426	Very Fast Implementation of Complex Systems on Silicon (IDPS) - TIP	MEL	158
2427	Transparent Object-Oriented Parallel Information Computing System (TROPICS)	IPS-II	65

2428	Intelligent Process Control by Means of Expert Systems (IPCES)	CIM	114
2430	A High Performance CMOS-Bipolar Process for VLSI Circuits (BICMOS)	MEL	160
2431	Home Systems (HOME)	OBS	154
2434	Knowledge-Based Real-Time CIM Controllers for Distributed Factory Supervision	CIM	116
2437	Industrial Characterisation of an Advanced Resonant Etcher (ICARE)	MEL	162
2439	Real Time Monitoring and Control of Construction Site Manufacturing (ROCOCO)	CIM	118
2443	Extensible KBMS for Large Knowledge-Base Application (STRECH)	IPS-II	67
2447	A European, Distributed Memory, Parallel Supercomputer for Numerical Applications (GENESIS)	IPS-II	69
2455	Large-Image Terminals (LIT)	OBS	157
2457	Knowledge-Based Planning and Control in Manufacturing Environments (FLEXPLAN)	CIM	120
2463	Application-Related Graphics in OSI Standards (ARGOSI)	OBS	159
2466	Knowledge Workers Intelligently Collecting/Coordinating/Consulting Knowledge (KWICK)	OBS	161
2469	Integrating Database Technology, Rule-Based Systems and Temporal Reasoning for Effective Software (TEMPORA)	IPS-II	71
2471	Parallel Execution of Prolog on Multiprocessor Architectures (PEPMA)	IPS-II	73
2474	A Multi-Modal Interface for Man-Machine Interaction with Knowledge-Based Systems (MMI2)	IPS-II	75
2476	Bank 92 (BANK 92)	OBS	163
2478	Research into Boundary Scan Test Implementation	MEL	164
2483	Perception and Navigation System for Autonomous Mobile Applications (PANORAMA)	CIM	122

2484	The Spirit-I Workstation (SPIRIT)	OBS	166
2486	Integrated CAE Techniques for Dynamic Analysis of Structures (ICTDAS)	CIM	124
2487	Maintenance, Validation and Documentation of Software Systems (REDO)	IPS-II	77
2499	CD-Rom Workbench (CDR)	OBS	168
2502	Variable Object Identification, Location and Acquisition (VOILA)	IPS-II	79
2512	Intelligent Area Communication and Information System (IACIS)	OBS	170
2518	Wafer and Epilayer Improvement Correlated with Device Performances for INP-Based Optoelectronics	MEL	166
2527	CIM System with Distributed Database and Configurable Modules (CIDAM)	CIM	126
2528	Operating Systems and Programming Environments for Parallel Computers (SUPERNODE II)	IPS-II	81
2537	Incremental Construction and Reuse of Requirements Specifications (ICARUS)	IPS-II	83
2563	General Distributed Architecture for Unified Communications in Heterogeneous OSI Environments (GAUCHO)	OBS	173
2565	Atmosphere (ATMOSPHERE)	IPS-II	85
2569	European Workstation (EWS)	OBS	176
2570	Maintenance Capability for Software (MACS)	IPS-II	89
2576	Acquisition of Knowledge (ACKNOWLEDGE)	IPS-II	91
2588	Design Support for Distributed Industrial Control (DSDIC)	CIM	128
2589	Multilingual Speech Input/Output Assessment, Methodology and Standardisation (SAM)	IPS-II	93
2590	Integrated Product Design System (IPDES)	CIM	130
2592	A Vision System Development Environment for Industrial Applications (VIDIMUS)	IPS-II	95

2615	Intelligent Training System in Industrial Environments (ITSIE)	IPS-II	97
2617	Communications Network for Manufacturing Applications (CNMA)	CIM	132
2620	Front-Ends for Open and Closed User System (FOCUS)	IPS-II	99
2623	Methods for Advanced Group Technology Integrated with CAD/CAM (MAGIC)	CIM	134
2626	Intelligent System for Automatic Processing of Design Codes of Practice (AUTOCODE)	CIM	136
2633	Magnetic Media for Future Ultra High Density Information Storage	MEL	168
2637	Advanced Robotics Manipulation System (ARMS)	CIM	138
2638	Advanced Display Optimisation Tools (ADOT)	OBS	179
2640	Integrated Intelligent Process Control and Inspection in Robot Finishing (ICI)	CIM	140
2649	Visual Arts Systems for Archiving and Retrieval of Images (VASARI)	OBS	182
2656	Intelligent Drive for Shop Floor Systems (IDRIS)	CIM	142
2658	Advanced Robotics in Flexible Automation Components, Tools and Strategies (ARTIFACTS)	CIM	144
2671	Knowledge-Based Multi-Sensor Systems in CIM Applications (KB-MUSICa)	CIM	146
2684	Multipoint Interactive Audiovisual System (MIAS)	OBS	184
2686	Cost Management with Metrics of Specification (COSMOS)	IPS-II	101
3001	Vision Systems for a Natural Human Environment (INSIGHT)	BR	108
3003	Categorical Logic in Computer Science (CLICS)	BR	64
3006	Theories of Concurrency: Unification and Extension (CONCUR)	BR	66

## MASTER INDEX BY ACRONYM

Acronym	Proj. No.	Title	Vol.	Page
ACCORD	1062	Computer-Aided Engineering Software for Advanced Workstations in the CIM Environment	CIM	57
ACCOR	3279	Articulatory-Acoustic Correlations in Coarticulatory Processes: A Cross-Language Investigation	BR	151
ACKNOWLEDGE	2576	Acquisition of Knowledge	IPS-II	91
ACORD	393	Construction and Interrogation of Knowledge Bases Using Natural Language Text and Graphics	IPS-I	49
ACQUILEX	3030	Acquisition of Lexical Knowledge for Natural Language Processing Systems	BR	110
ACTS	3207	High-Resolution Speech Recognition: Auditory/Connectionist Technologies for Speech	BR	139
ADCIS	2193	Analogue/Digital CMOS ICs	MEL	126
ADEPT	2331	Advanced Distributed Environment for Production Technology	CIM	106
ADKMS	311	Advanced Data and Knowledge Management Systems	IPS-I	36
ADOT	2638	Advanced Display Optimisation Tools	OBS	179
AIDA	888	Advanced Integrated-Circuit Design Aids	MEL	74
AIMBURN	2192	Advanced Intelligent Multisensor System for Control of Boilers and Furnaces	CIM	92
AITRAS	2167	An Intelligent Real-Time System for Signal Understanding	IPS-II	35
ALCOM	3075	Algorithms and Complexity	BR	80

ALF	1520	Advanced Software Engineering Environment Logistics Framework/ Accueil de Logiciel Futur	IPS-I	170
ALPES	973	Advanced Logical Programming Environments	IPS-I	113
AMADEUS	1252	A Multi-Method Approach for Developing Universal Specifications	IPS-I	148
AMICE	688	A European Computer Integrated Manufacturing Architecture	CIM	42
AMODEUS	3066	Assimilating Models of Designers, Users and Systems	BR	118
AMS	1551	Advanced Manufacturing System	MEL	106
ANNIE	2092	Application of Neural Networks for Industry in Europe	IPS-II	14
APACHIP	2075	Advanced Packaging for High Performance	MEL	122
APHRODITE	1535	A PCTE Host-Target Distributed Testing Environment	IPS-I	176
ARCHON	2256	Architecture for Cooperative Heterogeneous Online Systems	IPS-II	45
ARGOSI	2463	Application-Related Graphics in OSI Standards	OBS	159
ARMS	2637	Advanced Robotics Manipulation System	CIM	138
ARS	2101	Adverse-Environment Recognition of Speech	IPS-II	18
ARTIFACTS	2658	Advanced Robotics in Flexible Automation Components, Tools and Strategies	CIM	144
ARTS-IP	867	Adapting Real-Time Strategies for Image Processing: a Case for Satellite Data	IPS-I	88
ASAC	2394	Application-Specific Architecture Compilation	MEL	154

ASCIS	3281	Behavioural Synthesis, Partitioning and Architectural Optimisation for Complex Systems on Silicon	BR	55
ASPIS	401	Application Software Prototype Implementation System	IPS-I	51
ASSET	267	Automated Support for Software Engineering Technology	IPS-I	22
ASTRA	831	Advanced and Integrated Office Systems Prototypes for European Public Administrations	OBS	57
ATES	1158	Advanced Techniques Integration into Efficient Scientific Application Software	IPS-I	146
ATMOSPHERE	2565	Atmosphere	IPS-II	85
AUTOCODE	2626	Intelligent System for Automatic Processing of Design Codes of Practice	CIM	136
BANK 92	2476	Bank 92	OBS	163
BASIC GOODS	3191	Basic Research Actions for a Geographic Object-Oriented Database System	BR	97
BICMOS	2430	A High Performance CMOS-Bipolar ' Process for VLSI Circuits	MEL	160
BIPMS	2189	Building Industry Project Management System	CIM	90
BWN	73	Broad Site Local Wideband Communication System	OBS	18
