TOTAL	197676			160650			180231		
EUR-12									

The harvest of the 1992/93 wine year was very good compared with the previous year's (+ 23%) and good compared with the average for the previous five years (+ 9.7%). The increase in production, at the level of the Member States, ranges between 53% in France and 14% in Spain. Portugal is the exception with a shortfall in production of 22% due to particularly bad weather conditions. Production of quality wines psr was 9.7 million hl up on the 1991/92 wine year (+ 20%) and approximately 5 million hl up on the five-year average (+ 8.9%). Table wine production was up on the previous year by 16.2 million hl (+ 16%) and by 5.8 million hl (+ 5%) on the five-year average.

II. Utilization

From now on the supply balance will be examined on the basis of the figures for the Community of Twelve since Community rules from this wine year apply to Portugal for the measures as a whole.

Total utilization for EUR 12 for the 1992/93 wine year, comprising human consumption, industrial utilization (including grape juice), losses, Community distillation and the net balance of exports to non-member countries, amounts to 193 995 000 hl.

1. Human consumption

EUR-12 consumption in 1992/93 was 129 million hl. This is slightly up on the previous year (+ 1 462 000 hl) (also in Portugal) but down by 3% on the average for the wine years 1987/88-1991/92. The greatest variations were in the United Kingdom (+ 13%), in Belgium (+ 9.4%) and in the Netherlands (- 8%).

In terms of types of wine, consumption of quality wines psr was 49 271 000 hl, rising 8.2%, whilst that of table wine was 71 443 000 hl, falling 3.1%. A comparison with the average figure for the previous five wine years confirms that consumption of quality wines psr is progressing (+ 8.2%) but reveals a steady downward trend for table wines (- 8.7%).

2. Industrial utilization

This comprises quantities for processing into on the one hand wine spirits, i.e. 8.47 hl of other wine, and on the other hand juice (6.69 million hl), vermouth (2.23 million hl) and vinegar (1.125 million hl).

Overall, industrial utilization absorbed 18.5 million hl, a substantially higher figure than the average for the period 1987/88 to 1991/92 (13.5 million hl). It should be mentioned here that in 1991/92 the harvest of the grape traditionally intended for making wine spirits had been very poor.

3. Community distillation

This involved 33 million hl, of which 26.8 million were accounted for by compulsory distillation, (including 15.5 million for preventive distillation) and 6.2 million by support distillation.

4. Import and export trade

Most trade in wine is intra-Community. However, in 1993 trade with non-member countries expanded to some extent. Community exports to non-member countries account for 9.6 million hl, an increase of 10% on the previous wine year.

Imports from non-member countries amount to 3.3 million hl, which gives a net export balance of 6.3 million hl (an increase of 16.6% on 1991/92).

III. Stocks

End-of-year table wine stocks in the Community of Twelve show an increase of 3 million hl, and this notwithstanding the large quantities of wine accounted for by distillation. This figure corresponds to the shortfall in table wine consumption in relation to the estimates given in the forecast supply balance drawn up at the beginning of the wine year.

Stocks of quality wines psr are up by some 5 million hl on the previous wine year, but this represents a purely fictitious increase since the stocks of vintage Port wines with mention of age (4 679 000 hl) which require long periods for maturing had not been declared until this wine year; they are now included in the supply balance.

IV. Conclusions

The current market organization has failed to achieve stabilization in the wine-growing sector.

The reduction in winegrowing areas, due to subsidized grubblings, has had the sole effect of compensating for the continuing fall in human consumption and the rise in yields, and the complex system of distillations has failed to act as a deterrent for wine producers.

The increase in stocks at the end of the 1992/93 marketing year after distillations confirms this observation.

This structural imbalance has had the effect of increasing the disparities between the different regional winegrowing economies and makes it necessary for the Community to pay out large sums to dispose of the surpluses.

The outlook for the wine sector in the medium term is one of large surpluses estimated to reach some 24 million hl by the year 2000. This prospect has prompted the Commission in July 1993 to present a discussion paper to the Council with a view to preparing a reform of the organization of the market in wine aimed at achieving a balance between production and consumption and, at the same time, improvement in quality.
