The Commission of the European Communities
Directorate General Agriculture
Unit: VI/A-3
rue de la Loi, 130
1049 Brussels
Belgium.
Tel (32)(2) 235.11.11.

This publication has been prepared within the unit "Analysis of the situation of farms in agriculture" (VI/A-3) by John McClintock (consultant - authorship and coordination).

Bernard Brookes, Javier Gallego, Jean-François Hulot, Russell Mildon, Nigel Robson, Michel Tillieut, William Vertriest and Rosario Villanueva provided useful remarks, advice and suggestions.

Angela Fairbank performed the word processing, text presentation and formatting. The author thanks Paul Bantzer, Cornelis Broekhuizen, Jacques De Dooy, Raymonde Denagtergael, Arlette Fernandes, Alain Joaris, Gina Lopes, Ricardo Rocha, Muriel Werts and Anne-Marie Wielki for their assistance in the writing and production of this A-Z. He also thanks delegates of the FADN Community Committee for their remarks on earlier drafts.

1st Edition August 1989

EDITORIAL NOTE

Throughout the document, the names of the Member States of the European Communities are given in their national languages. The English equivalents are as follows:

Belgi(qu)e	Belgium
Danmark	Denmark
Deutschland	West Germany
Ellas	Greece
Espana	Spain
France	France
Italia	Italy
Luxembourg	Luxembourg
Nederland	The Netherlands
Portugal	Portugal

1. INTRODUCING THE FARM ACCOUNTANCY DATA NETWORK (FADN)

1.1 What is FADN?

As background to policy initiatives and decisions, the Commission of the European Communities needs:

- i) information on the level of farm incomes;
- ii) analyses of the effects of policy options.

The Commission has established FADN to provide these functions. It is a pan-EC system of sample surveys that take place each year and constitutes an important tool within the Commission's technical apparatus for supplying information and executing analyses.

1.2 Why is an A-Z of FADN necessary?

Running a pan-EC system of surveys is a difficult task. For the data to be accurate and to reflect the enormous variation in Community⁽¹⁾ agriculture, the sample surveys must be very carefully designed and executed. For instance, the Commission needs to ensure that the sample of farms represents both large and small farms. The terms used - such as Net Farm Income and Cash-Flow - must carry exactly the same meaning in all twelve Member States. All the data received by the Commission need to be thoroughly and systematically checked.

Principles such as these mean that FADN has been developed by the Commission staff into a harmonised system of sample surveys, using precisely defined terms, carefully elaborated selection methods and transparent, comprehensive control procedures.

It is to explain these terms, methods and procedures that this document, designed as a companion volume to the Community FADN Farm Return, has been written.

1.3 Data is confidential

Incorporated into the founding legislation of FADN is a stipulation that all data relating to individual farms received by the Commission are to be treated with the utmost confidentiality. Consequently, data at the level of individual farms are not normally released outside the Directorate General for Agriculture of the Commission. Only aggregated results for a group of farms and for farms within regions and Member States are published since, at this level of aggregation, information relating to individual farms cannot be discerned.

(1) Unless otherwise stated, the term 'Community' refers to the Community of 12 Member States (Belgi(qu)e, Danmark, Deutschland, Ellas, España, France, Ireland, Italia, Luxembourg, Nederland, Portugal, United Kingdom). EUR10 refers to the Community of 10 Member States that existed before the accession of Espana and Portugal on 1 January 1986.

1.4 Liaison Agencies collect data

The Commission does not directly collect data itself. This is the responsibility of a Liaison Agency in each Member State and is either undertaken by the Liaison Agency itself or by bodies nominated by it. Each Liaison Agency is guided for the purposes of FADN by a National FADN Committee. Chapter 4 provides more information on Liaison Agencies.

1.5 Reimbursement by the Commission

The Commission recognises that participation in the FADN survey imposes a cost on the Liaison Agencies. It thus makes a fixed payment to the Liaison Agencies towards the cost of converting Member State data to the format required by the Commission. A payment is made for each successfully completed Farm Return received by the Commission.

1.6 FADN is principally concerned with agriculture

The FADN survey covers the entire range of agricultural activities carried out on farms. However, it also collects data on some non-agricultural farming activities (such as tourism and forestry).

1.7 FADN is guided by a Community Committee

The operation of FADN is guided by a management committee which generally meets twice a year. The committee is known as the FADN Community Committee and consists of representatives of the Liaison Agencies of the Member States. It is chaired by a staff member of the Commission and amongst its other duties considers all legislation relating to FADN.

1.8 Founding legislation

The legislation establishing FADN is Council Regulation 79/65/CEE of 15 June 1965⁽¹⁾. This legislation has since been modified and expanded - Annex II includes a list of all relevant regulations and decisions.

(1) OJ No 109, 23.6.1965, p. 1859/65.

2. DEFINING THE FIELD OF OBSERVATION

2.1 The universe of farms

The term "universe" is a statistical term which is used to define the set of units under enquiry. In the present context, the universe of farms is that set of farms in the Community of at least 1 hectare and those of less than 1 hectare provided the latter market a certain proportion of their output or produce more than a specified amount of output⁽¹⁾.

2.2 The field of observation consists of "commercial" farms

In the universe there are some farms which produce little output and from this point of view do not warrant inclusion in the FADN sample. Thus, in defining FADN's field of observation, the Commission follows the guidelines specified in Regulation 79/65/EEC of 15 June 1965⁽²⁾ and subsequent amendments⁽³⁾ and adopts a pragmatic approach by including only those farms deemed to be commercial (see Figure A).

Figure A The universe and the field of observation

The extent to which the field of observation covers the universe is described in section 2.6. For many products and farm types coverage is greater than 90% (see Table 3).

-
- (1) For more details of which farms are included in the universe see the Eurostat publication: Farm structure - methodology of Community surveys. Theme 5 Series E. Published by the Statistical Office of the European Communities, 1986.
 - (2) OJ No 109, 23.6.1965, p. 1859/65.
 - (3) A list of all legislative instruments pertaining to the FADN is given in Annex II together with the serial numbers of the Official Journals in which they are published.

A commercial farm is defined as a farm which is large enough to provide a main activity for the farmer and a level of income sufficient to support his or her family. In order to be classified as commercial, a farm must exceed a minimum economic size. The calculation of economic size is explained in sections 2.3 and 2.4.

2.3 The economic size of farms: Standard Gross Margins and European Size Units

2.3.1 Standard Gross Margins

The concept of Standard Gross Margin (SGM) is used to determine the economic size of farms, which is expressed in terms of European Size Units (ESU). This concept is also used in the Farm Structure Survey organised by the Statistical Office of the European Communities (Eurostat).

! DEFINITION !

! The Standard Gross Margin (SGM) of a crop or livestock item !
! is defined as !
! the value of output from one hectare or from one animal !
! less !
! the cost of variable inputs required to produce !
! that output. !

For each region all crop and livestock items are accorded an SGM. The SGM is calculated by Liaison Agencies themselves on the basis of empirical data collected from farms. To avoid bias caused by fluctuations e.g. in production (due to bad weather) or in input/output prices, three year averages are taken (1). SGMs are expressed in Commission publications in European Currency Units (ECU).

SGMs are updated every two years (2) and are calculated on a regional basis for a total of 91 separate crop and livestock items. This large number of items not only reflects the diversities of agriculture within the Community but also indicates the level of detail that is required to ensure that the results of FADN and other surveys are both comprehensive and reliable.

-
- (1) To denote the average of a three-year period, inverted commas are used. For example, "1973" denotes the average for the period of 1972 to 1974.
- (2) SGMs for "1982" are given in Notice No: 86/C 191/02, OJ No C 191, 29.7.1986, p. 2. SGMs for "1984" are given in Notice No: 88/C 133/01, OJ No C 133, 24.5.1988, p. 1.

2.3.2 European Size Units

The economic size of farms is expressed in terms of European Size Units (ESU). The value of one ESU is defined as a fixed number of ECU of Farm Gross Margin. Over time the number of ECU per ESU changes to reflect inflation. Table 1 shows the value of one ESU according to the set of SGMs that are used.

Table 1 The value of 1 ESU according to the set of SGMs that are used

SGM	1 ESU is equivalent to:
"1973"	1000 ECU (SGM "1973")(1)
"1980"	1000 ECU (SGM "1980")
"1982"	1100 ECU
"1984"	1200 ECU

2.4 Procedure for determining farm size in ESU

There are five steps in the determining of farm size in ESU. These are shown in Figure B.

2.5 Delimitation of the field of observation

As stated above, those farms which exceed a certain economic size in ESU are defined as commercial, and thus fall into the field of observation. But, because of the different farm structures in the Community, it is necessary to specify separate thresholds for each Member State. The thresholds in recent accounting years are shown in Table 2.(2)

2.6 The extent to which FADN's field of observation covers the universe

The proportion of the universe that is covered by the field of observation in each Member State is, in most instances, substantial as Table 3 indicates.

(1) In order to convert SGM "1973" to SGM "1980", the former should be multiplied by a coefficient of 1.7. In other words, 1000 ECU of SGM "1973" are equivalent to 1700 ECU of SGM "1980".

(2) In certain cases a maximum threshold is applied. This is to ensure the confidentiality of information from very large holdings.

Figure B Procedure for deriving the economic size of farms in ESU.

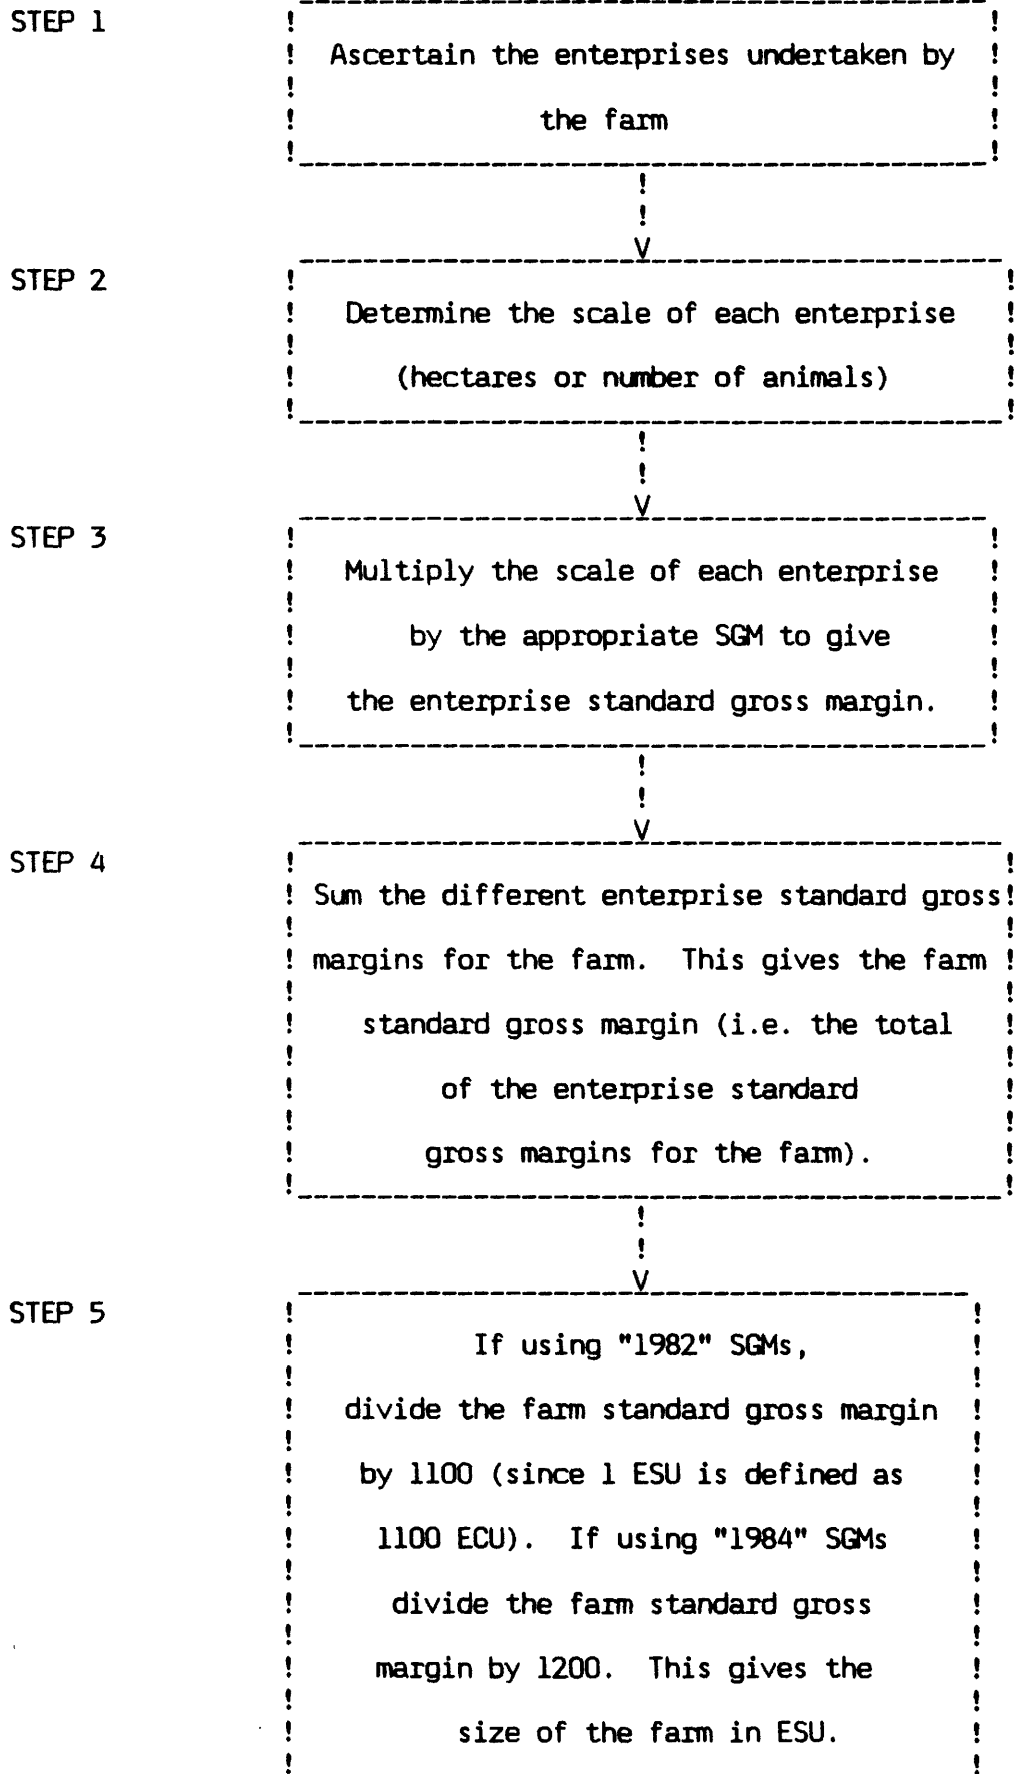

Table 2 Economic size thresholds applied by the Commission (in ESU)

Value of 1 ESU	For 1982/3 - 1985/6	For 1986/7 accounting
	accounting years (1)	year and following (2)
	1000 ECU of SGM "1973"	1100 ECU of SGM "1982"
Belgi(qu)e	6	12

Source: derived from Eurostat: Farm Structure 1985 survey: main results Theme 5, Series C, published by Statistical Office of the European Communities, Luxembourg.

(1) Figures have been rounded to the nearest whole percent.

(2) The degree of coverage for the UK has been calculated using a threshold of 8 ESU. This threshold is, in fact, used only for England, Wales and Scotland. A lower threshold of 4 ESU is used for Northern Ireland. This means that the figures given in the above table understate to a certain degree the extent to which the field of observation covers the universe.

(3) The term "holding" is broadly equivalent to the term "farm".

3. SELECTING THE SAMPLE OF FARMS FROM FADN'S FIELD OF OBSERVATION

3.1 Introduction

This chapter describes how farms are selected and the techniques that are used to achieve as high a degree of representativity as possible.

3.2 Member States conduct their own selection

Before the creation of FADN, several Member States were already conducting agricultural surveys based on farm accounts. Some of these surveys were based on a selective sample of farms - as opposed to the entire population of farms. To select a sample of farms, these Member States had established their own selection plans.

Most Liaison Agencies of the Member States continue to conduct national surveys and have thus retained their own selection plans. The current practice is for Liaison Agencies to design their own selection plans for the Community survey. The plans are submitted to the FADN Community Committee for approval. They vary in technical sophistication from one Member State to another.

3.3 Stratification

3.3.1 The use of stratification

Within FADN's field of observation, there is a great diversity of farming. Some farms are very large (in terms of their economic size) while others may be very small. Some farms concentrate on crop production, others specialise in livestock rearing while still others practice mixed farming; that is, both crop and livestock production. On these two criteria - economic size and type of farming - alone, the field of observation of Community farms is highly heterogeneous.

To ensure that the sample of farms adequately reflects this heterogeneity, Liaison Agencies stratify the field of observation before the sample of farms is selected. If this were not done, there would be a greater risk that particular categories of farm (say, large dairy farms in one region, or small fruit farms in another region) would not be represented adequately (or even at all) by the sample.

Stratification is a statistical technique which is used to increase sampling efficiency (i.e. to minimise the number of farms required to represent the variety of farms in the field of observation). The Commission makes extensive use of this technique and uses three criteria for stratification; region, economic size and type of farming, as described in the following section (3.4).

3.3.2 Region

For FADN purposes the Community is divided into 91 regions. These are shown in Figure C. Table 4 shows how the regions in each Member State correspond to those defined by the Statistical Office of the European Communities (Eurostat), published as the Nomenclature of Territorial Units for Statistics (NUTS). FADN regions are specified in Commission Regulation 1859/82/EEC of 12 July 1982⁽¹⁾ and, for Spain and Portugal, in Commission Regulation 3122/85/EEC of 6 November 1985⁽²⁾.

3.3.3 Economic size

Section 2.3 describes the concept of economic size and its calculation. All farms in FADN's field of observation are classified under the "new typology" into one of nine size classes, these being defined in Annex III of Commission Decision 85/377/EEC of 7 June 1985⁽³⁾ and given in Table 5.

3.3.4 Type of farming

The third and final criterion used for stratification of the FADN field of observation is type of farming - this being defined in economic terms and not in physical terms. A detailed typology has been created for use by various bodies at the Community level. It is sufficiently broad to encompass the many different types of farming that are found in the Community. This typology is described in Commission Decision 85/377/EEC of 7 June 1985⁽³⁾.

The typology identifies 17 principal types of farming, as shown in Table 6, which are further broken down into 50 particular types. How are farms allocated to a specific type? In other words, what are the definitions of the different types of farming?

Types of farming are defined in terms of the relative importance of the different enterprises on the farm. Relative importance is itself measured quantitatively as a proportion of each enterprise's SGM to the farms' total SGM. An example of classifying a farm is given after Table 6.

For the purposes of computing Standard Results, the Commission uses nine groups of farming types, which are given in Table 29, page 71. For more information on how these Standard Results are calculated and published, readers are referred to Chapter 7.

3.4 The universe and field of observation represented as a matrix of cells

The 3-way stratification of the universe allows it to be represented as a 3-dimensional matrix of cells. Each cell corresponds to a specific category of farms. Figure D illustrates this.

- (1) the value of 1 ESU changes over time to reflect inflation (see 2.3.2 for further details)
(2) as defined in Commission Decision 78/463/EEC of 7 April 1978, OJ No L 148, 05.06.1978.
(3) as defined in Commission Decision 85/377/EEC of 7 June 1985, OJ No L 220, 17.08.1985.

Table 6 Principal types of farming as specified in the Community typology of agricultural holdings

	<u>Principal type</u>	<u>Usual regrouping used in FADN Standard Results</u> ⁽¹⁾
11	Specialist cereal	A
12	General field cropping	B
60	Mixed cropping	B
20	Specialist horticulture	C
31	Specialist vineyards	D
32	Specialist fruit and citrus fruit	E
33	Specialist olives	E
34	Various permanent crops combined	E
41	Specialist dairying	F
42	Specialist cattle-rearing and fattening	G
43	Cattle-dairying, rearing and fattening combined	G
44	Sheep, goats and other grazing livestock	G
50	Specialist granivores	H
71	Mixed livestock, mainly grazing livestock	I
72	Mixed livestock, mainly granivores	I
81	Field crops-grazing livestock, combined	I
82	Various crops and livestock, combined	I

(1) See also Table 29, page 71.

! EXAMPLE: CLASSIFYING A FARM ACCORDING TO THE COMMUNITY TYPOLOGY (1)!
!-----!

! Assume: a farm with 50 dairy cows and 10 breeding sows. !
! From the list in Table 6, two principle types of farming would appear to !
! be suitable descriptions of this farm, viz.: !

- ! 41 Specialist dairying !
- ! 71 Mixed livestock, mainly grazing livestock !

! To which type of farming does this farm belong? !

<u>Enterprise</u>	<u>SGM</u>	<u>Size of enterprise</u>	<u>Enterprise SGM</u>	<u>Enterprise SGM</u> <u>as proportion</u> <u>of farm's total</u> <u>SGM</u>
Dairying	700	50 dairy cows	35,000	92%
Breeding sows	300	10 breeding sows	<u>3,000</u>	<u>8%</u>
		<u>Farm's total SGM</u>	<u>38,000</u>	<u>100%</u>

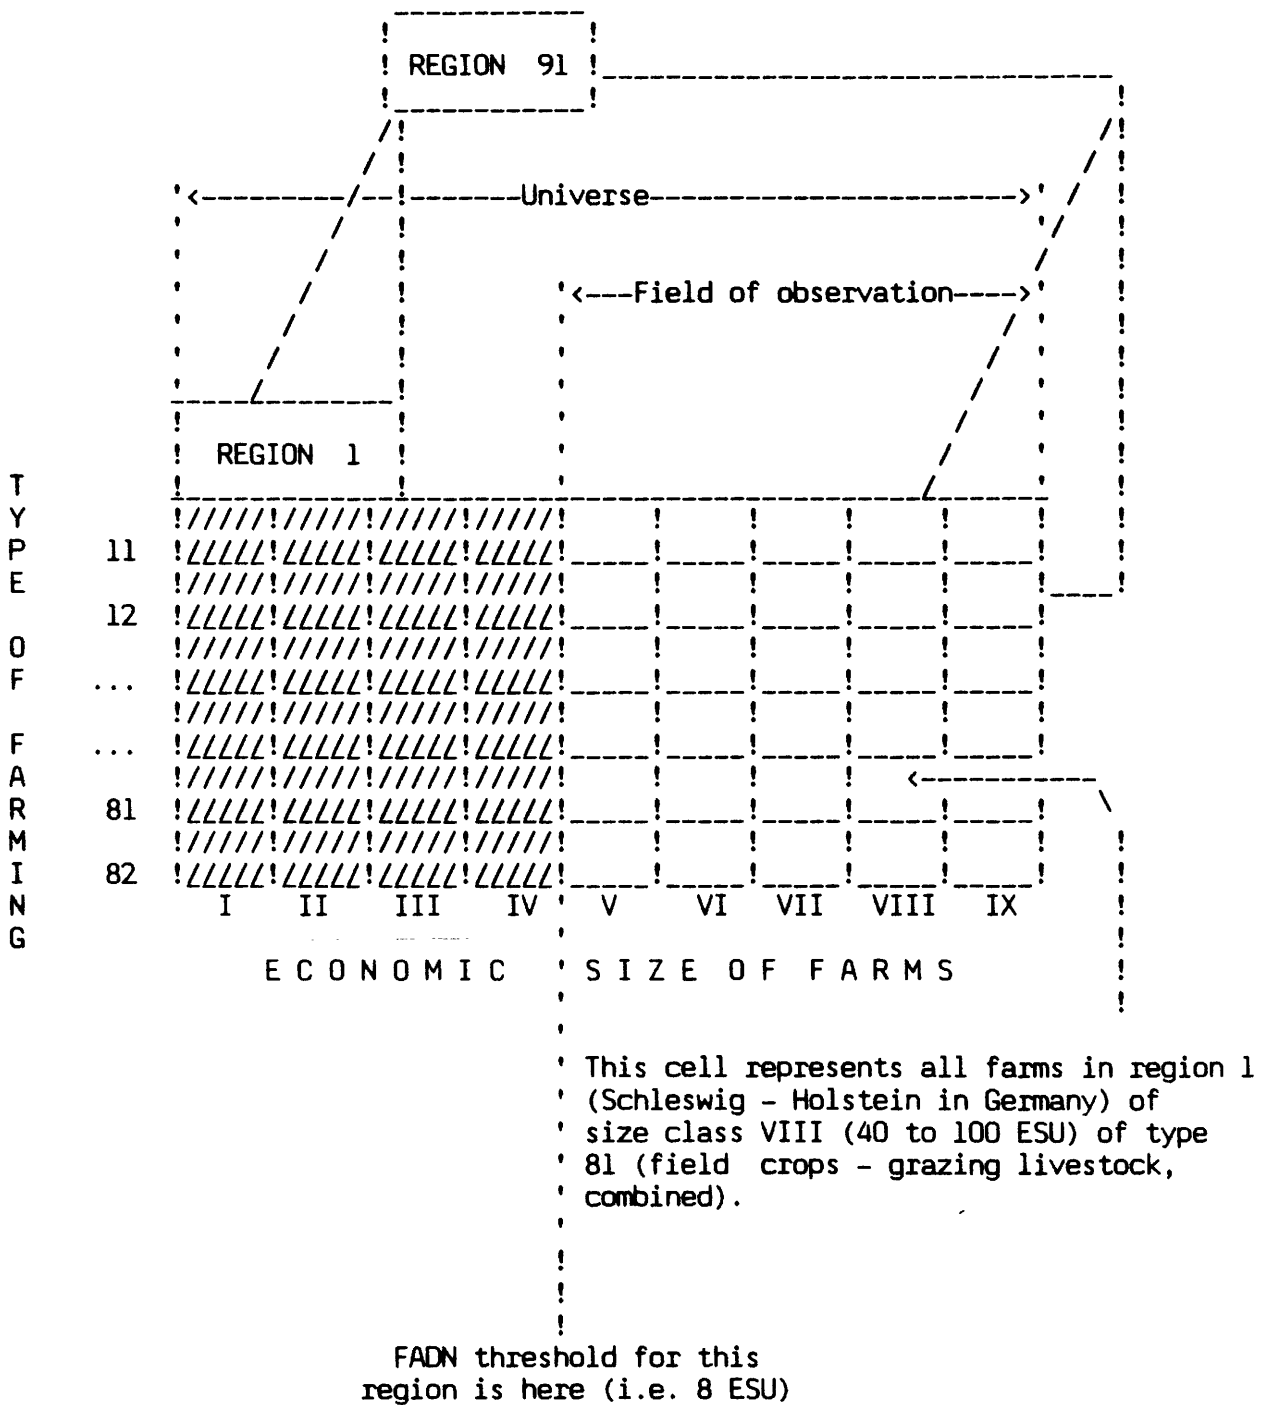

! The definition of the two principal types of farming are as follows: !

- ! 41 - specialist dairying: Dairy cattle contribute > 2/3 of farm's total !
! SGM !
- ! 71 - Mixed livestock, mainly grazing livestock: Grazing livestock !
! contribute between 1/3 and 2/3 of farm's total !
! SGM. !

! Since dairying contributes > 2/3 of farm's total SGM, this farm is !
! classified as 'specialist dairying' !

(1) The typology is described in Commission Decision 85/377/EEC of 7 June 1985, and is published in OJ No L 220, 17.8.1985, p. 1.

Figure D The universe and field of observation as a matrix of cells

Notes: For the names of regions see Figure C
 For the definitions of economic size of farms see Table 5
 For the definition of types of farms see Table 6

Some cells represent a large number of farms: for instance there are approximately 20 000 farms of 2 - < 4 ESU in the cell for Irish farms that practise farming type 42 - specialist cattle (rearing and fattening).⁽¹⁾ Other cells represent very few farms: in Denmark for example, there are only about 50 farms of size 6 - < 8 ESU which practise farming type 50 - granivores (pigs and poultry). Needless to say, some cells are empty - such as those representing vineyards, big or small, in Scotland.

The Commission and the Liaison Agencies select the sample of farms not from the field of observation as a whole but from the cells which make up the field of observation. Sample farms are thus selected from each cell - in this way all the cells are, in principle, represented in the sample. Thus the FADN sample of farms reflects the heterogeneity in the field of observation. (See Chapter 6 for further details concerning the extent to which the sample represents the field of observation).

The remainder of this chapter discusses the number of farms that are selected and the degree of randomisation in the selection procedures.

3.5 Determining the optimal size of the sample

Sampling fractions vary from cell to cell. In some Member States, the Liaison Agencies have sufficient data on the variability of farms within the field of observation to compute optimal sampling fractions. In other cases, this is not possible and sampling fractions are set according to the number of farms in the cell. More details are given in Table 7.

After the selection plan is drawn up, farms can shift from one cell to another if there is a change in their economic size or type of farming. This and other similar factors influencing the sampling fraction are discussed in 3.9.

3.6 The extent to which the sample is random

Ideally, farms are selected at random from the field of observation. However, various factors prevent full randomisation:

- i) Availability of farm accounts. To complete the Community FADN Farm Return, a suitable set of farm accounts (or similar financial information such as receipts, invoices, etc.) must be readily available. Some farmers do not have the necessary information at hand, and in these instances it is impractical to attempt to complete the Farm Return. In some countries, the Liaison Agencies assist farmers to keep accounts if these would not otherwise be kept.

(1) The number of farms in each cell is derived from the Farm Structure Survey (FSS) which employs the same typology as that used for FADN. The FSS is organised by the Statistical Office of the European Communities (Eurostat).

Figure E-----Accounting years for Member States

In some Member States the beginning of the accounting year is not the same for all farms. This has the effect that the period for the Member State as a whole (as indicated in the figure below) extends to more than 12 months.

Source: Liaison Agencies of the Member States.

Footnotes to Figure E

- (1) In Belgium, some horticultural holdings have accounting years from 1 January to 31 December whilst others have accounting years running from 1 May to 30 April.
- (2) In Denmark, the accounting year for horticulture begins on 1 January and ends 31 December. For half of the agricultural accounts the accounting year starts on 1 January and ends 31 December. For the remainder, the accounting year starts on either 1 April, 1 May or 1 June and ends 12 months later.
- (3) In France, the beginning of the accounting year for a small number of farms falls between 1 October and 31 December of the preceding year (comptabilités fiscales).
- (4) The accounting year in the United Kingdom runs from 31 December to 30 of April.

Overall, the number of farmers keeping accounts is gradually increasing. One reason for this is the stipulation under Council Regulation 797/85/EEC of 12 April 1985⁽¹⁾ (on the modernisation of farms) that farmers receiving capital aid must keep farm accounts.

ii) Voluntary participation. The participation of farmers is on a voluntary basis. Some of those farms initially selected for the sample may not want to participate. In this case, the farm will be replaced by drawing another farm from the same cell in the field of observation.

As a result, the sample is, effectively, drawn at random from the subset of farms within the field of observation that fulfill the above two conditions.

3.7 Selection plans

Before the beginning of each accounting period, Liaison Agencies are obliged to draw up a selection plan⁽²⁾, which they then submit to the Commission for approval. In considering the selection plans, the Commission takes account of the opinion of the FADN Community Committee. The selection plan details the intended size of the sample, the distribution of the sample between different cells and the method by which farms are selected from the field of survey.

Liaison Agencies subsequently report on the extent to which it has been possible to implement the selection plan⁽²⁾. Problems in implementation may mean that there are not enough farmers who are willing to participate from particular cells and that the actual sample may fall short of the intended size and distribution.

3.8 Selection procedures in Member States

A variety of procedures are used as summarised in Table 7.

3.9 The size of the FADN sample

3.9.1 The reasons why the intended sample size may not be attained in practice.

There are several reasons why the intended sample size may not be attained or, indeed, may be surpassed. For example, it may be difficult to find sufficient farmers in a particular cell who are both willing to participate and who have the necessary information available (see 3.6). Another explanation may be that a participating farmer may give up farming before the completion of the accounting year. A further reason may be that the Community FADN Farm Return is incorrectly completed and unable to be corrected, thus failing at the control stage. (See Chapter 5 for further details on data validation and control).

(1) OJ No L 93, 30.03.1985.

(2) In accordance with article 6 of Council Regulation 79/65/EEC of 15 June 1965, OJ No 109, 23.6.1965, p.1859/65 and subsequent amendments.

Table 7 Determination of sample size and method of selection(1) of the FADN sample, by Member State

	Determination of sample size			Method of selection(1)
	A fixed number of farms from each cell in the field of observation	A fixed proportion of farms from each cell in the field of observation	A variable proportion-taking account of variability in the field of observation	
Belgi(qu)e			Yes	Non-random
Danmark			Yes	Random
Deutschland			Yes (Neymann-Tschuprow)	Random
Ellas	Yes			Non-random
Espana		1% (except for large cells where sample is increased)		Non-random
France			Yes	Random
Ireland	Yes			Random
Italia			Yes (Neymann-Pearson)	Non-random
Luxembourg		Yes		Random
Nederland			Yes	Non-random
Portugal		Yes		Non-random
United Kingdom			Yes	Random

Source: Liaison Agencies of the Member States.

- (1) Since farmers participate in the FADN survey on a voluntary basis, Liaison Agencies do not randomly select the sample of farms from the population of all farms in the field of observation but rather from that sub-population of all farms whose farmers agree to participate (see 3.6 for more details).

Figure F The number of farms at different stages in the selection process

Size of the field of observation:
being the number of farms in cell
A of the field of observation

N

Intended sample size:
being the number of farms
specified on the selection
plan

n

Number of farms selected:
the number of farms selected
may fall short of the number
specified in the selection
plan because there may not
be enough farmers that
i) keep accounts or financial
records, ii) agree to participate,
iii) have financial
accounts ending 31 December to
30 June. This number is
represented by x.

n-x

Number of farms surveyed:
being the number of farms for
which the survey form is
completed. This may be less
than the number of farms
selected because during the
course of the survey year
some farmers may cease farming
and others may change their
size/type and thus switch from
cell A to another cell. The
number of drop-outs is represented
by y.

n-(x+y)

Actual sample size:
being the number of Farm Returns
which are fully and correctly
completed and received by the
Commission for cell A. The
number of incomplete or
incorrect forms is represented
by z.

n-(x+y+z)

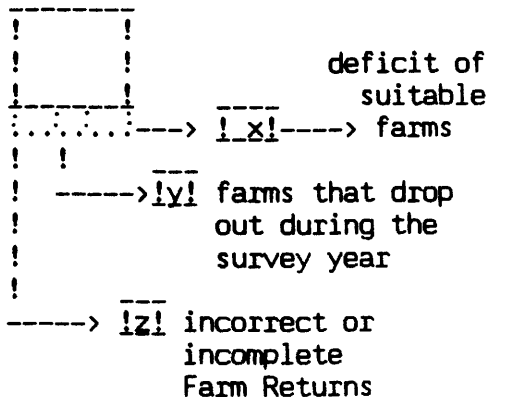

Figure G: The size of the actual sample since 1968

(1) The intended sample size for 1989 is 62,400. See Commission Regulations 1859/82/EEC of 12 July 1982, OJ No L 205, 13.07.1982; 3368/84/EEC of 30 November 1984, OJ No L 313, 01.12.1984; 3122/85/EEC of 6 November 1985, OJ No L 297, 09.11.1985.

Figure F illustrates the various stages during the selection process at which farms may be lost from the intended sample. It should be noted, of course, that not all farms are strictly 'lost' - those farms that change from one cell to another will remain in the field of observation and thus in the FADN sample.

3.9.2 Actual sample size in recent years

The FADN sample size which is constantly increasing is shown in Figure G. Sample sizes and average weights of a sample farm differ between Member States as Table 8 shows. The data are for 1986 and those for Spain are provisional. Tables 9 to 21 give details on the dispersion of the sample over the different cells. In some of the tables which follow, a number of classes of types of farming and/or economic size have been combined.

Table 8 Actual sample size and average weight of a sample farm for Member States and for the Community (1986)

	Actual sample size	Number of farms represented in the field of observation	Average weight of a sample farm
Belgi(qu)e	1,022	55,185	54
Danmark	2,278	85,402	37
Deutschland	5,224	374,431	72

Note 1: The use of minimum thresholds means that the FADN sample does not include farms below 16 ESU. In the above table this area is hatched. Those cells that are hatched above the threshold contain no farms at the level of the field of observation and thus are not covered by FADN.

Note 2: a zero (0) in a cell indicates that although there may be farms in the field of observation, none has been selected for the sample.

4. THE COLLECTION OF DATA FROM FARMS

4.1 Responsibility rests with Liaison Agencies of the Member States

The responsibility for FADN data collection rests with the Liaison Agencies, often together with agricultural research institutes. These either employ their own staff to visit the sample farms and collect the data, or they contract this work to accountants, universities, farmers' cooperatives or other organisations.

4.2 Confidentiality is maintained

Council Decision 79/65/EEC of 15 June 1965⁽¹⁾ - the basic legal instrument establishing FADN - clearly states that data supplied to the Commission are treated in the strictest confidence.

4.3 Time period for data collection

The Community FADN Farm Return relates to a period of twelve months. Member States have accounting years starting on different dates (see Figure E).

4.4 The Farm Return

The Farm Return is specified in Commission Regulation 2237/77/EEC of 23 September 1977⁽²⁾ and subsequent amendments. These same regulations contain detailed instructions on how the Farm Return is to be completed and provides definitions of the terms used. The Farm Return and associated regulations are published as Section III of "Handbook of Legislation Instructions, -Notes- for Guidance" by the Commission. The main tables of the return are now briefly described:

Table A: General information - code number of the farm together with farm type and economic size.

Table B: Type of occupation - the proportion of the farm area that is owned, rented or sharecropped.

Table C: Labour - quantity of labour and type of labour (paid or unpaid, regular or casual, etc.).

Table D: Number and value of livestock - opening and closing valuations of all farm livestock, together with the average numbers of livestock.

Table E: Livestock purchase and sales - the value of such transactions together with the value of any farmhouse consumption of livestock.

Table F: Costs - the costs of labour and machinery upkeep, feedingstuffs, crop variable costs, overheads, land charges and interest paid.

Table G: Land and buildings, deadstock and circulating capital - valuations, investment, sales and depreciation (at replacement cost).

(1) OJ No L 109, 23.6.1965, p. 1859/65.

(2) OJ No L 263, 17.10.1977, p. 1.

Table H: Debts - opening and closing valuations of short-, medium- and long-term loans.

Table I: Value Added Tax (VAT) - the VAT system applying and in certain cases VAT payments and receipts.

Table J: Grants and subsidies - the value of the above on all farm inputs and outputs (except investment items).

Table K: Production of crops and animal products - the area, quantity and value of all crops, animal products and other activities.

Production of live animals is covered in Table E.

4.5 The source of data at the farm level

The required data are extracted from the appropriate inventory, cash book, ledger or journal kept by the farmer or field officer. In some Member States, the Liaison Agencies have drawn up special entry books for farmers to complete periodically.

4.6 Organisational structure for data collection

National committees comprise representatives of both the Liaison Agency and the bodies responsible for completing the Farm Return. They give guidance on the methodological aspects of the survey, such as the application of the Community typology of farms, the selection of farms from the field of observation and the interpretation of terms.

In some Member States, equivalent committees exist also at regional level. The different structures for data collection are shown for each Member State in Figures H.1 to H.12.

Figure H.1 Belgium: Organisational structure for collecting FADN data

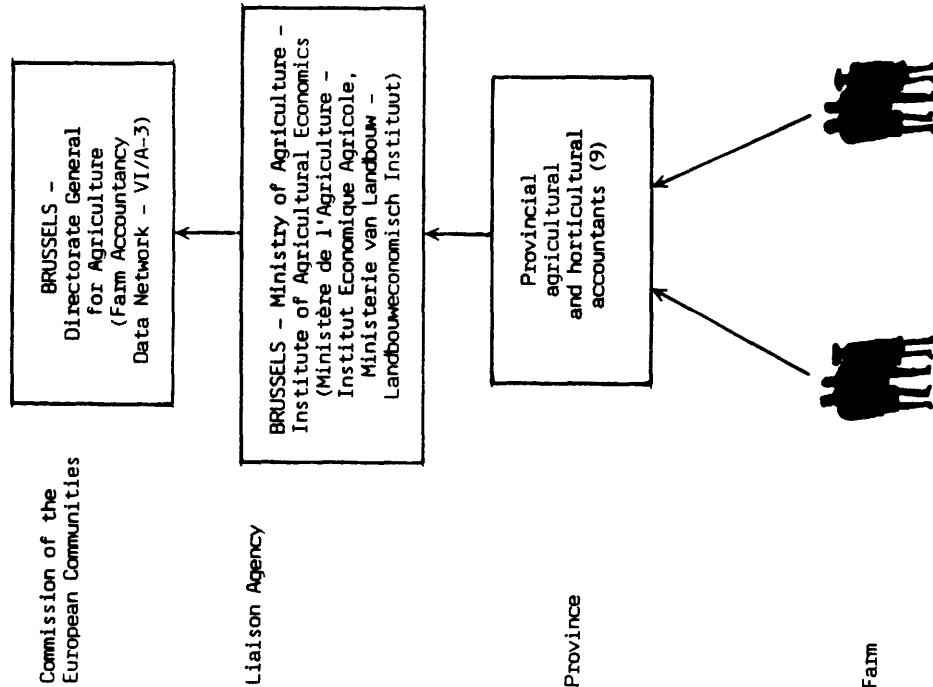

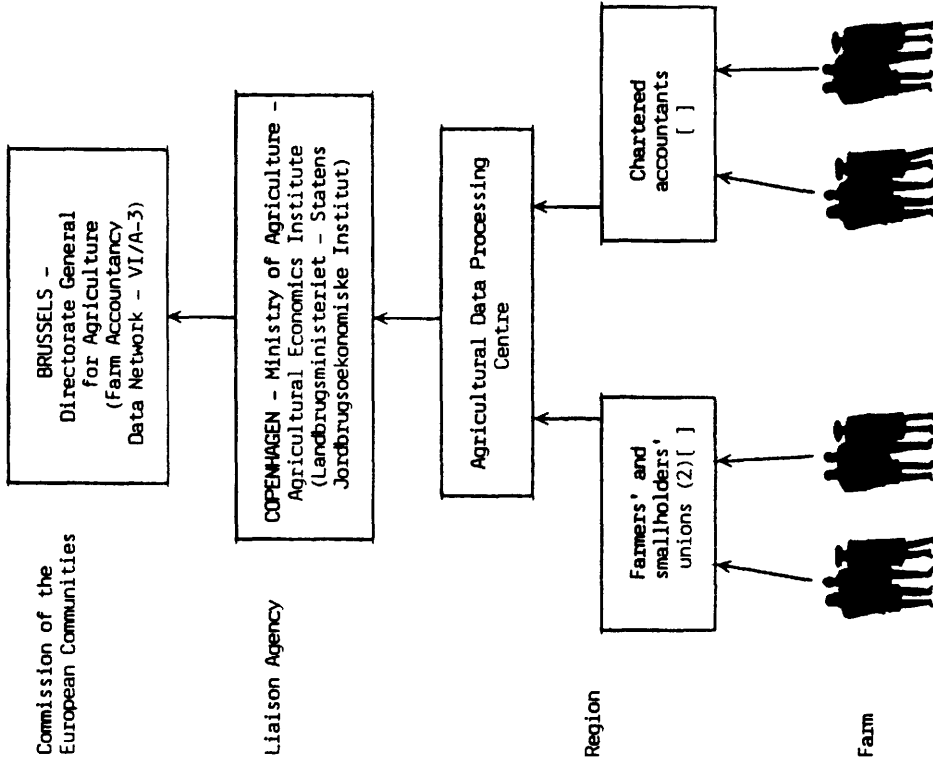

Figure H.2 Denmark: Organisational structure for collection of FADN data (1)

(1) All agricultural accounts are collected by the farmers' and smallholders' unions. Horticultural accounts are collected by both the farmers' and smallholders' unions and the chartered accountants.
 (2) Accountancy offices exist within the farmers' and smallholders' unions.

5. ENSURING THE HIGH QUALITY OF FADN DATA

5.1 The need for quality control

Decisions regarding agricultural policy in the Community must be based on sound and accurate analyses. This means that FADN data themselves must be as sound and accurate as possible. The Liaison Agencies and the Commission take great care to ensure that any errors in FADN data are identified and corrected.

This chapter describes the procedures for ensuring a high quality of accounting data. Those procedures used by the Liaison Agencies, before the data are received by the Commission in Brussels, are first outlined (5.2). This is followed by a description of the procedures used by the Commission (5.3). The final section (5.4) discusses the timetable for these exercises.

5.2 Quality control procedures followed by Liaison Agencies

Liaison Agencies invariably use one or more regional or national farm returns rather than the Community FADN Farm Return. This situation has arisen because before the creation of a European network, many Member States were already running farm business/management surveys and had thus designed their own farm returns. Over time, the original farm returns may have been improved and adapted to suit the changing needs of users. They provide data for first, the Member States' own purposes and secondly for FADN purposes. The objectives of the Member States may be different from those of the Commission. The Community FADN Farm Return is narrower in its coverage of farming activities than many of the regional and national farm returns.

Liaison Agencies use their own control programmes to maintain a level of data quality which may be higher or lower than the standard required by the Commission. When the data are error-free, the Liaison Agencies convert their national data to the Community FADN Farm Return as specified in Commission Regulation 2237/77/EEC of 23 September 1977⁽¹⁾ and subsequent amendments. Having done this, they may opt to run the Commission's control programmes on their own computers. When the Liaison Agencies are satisfied that the data are error-free, they send the data tape to Brussels. These procedures are summarized in Figure J.

5.3 Quality control procedures followed by the Commission

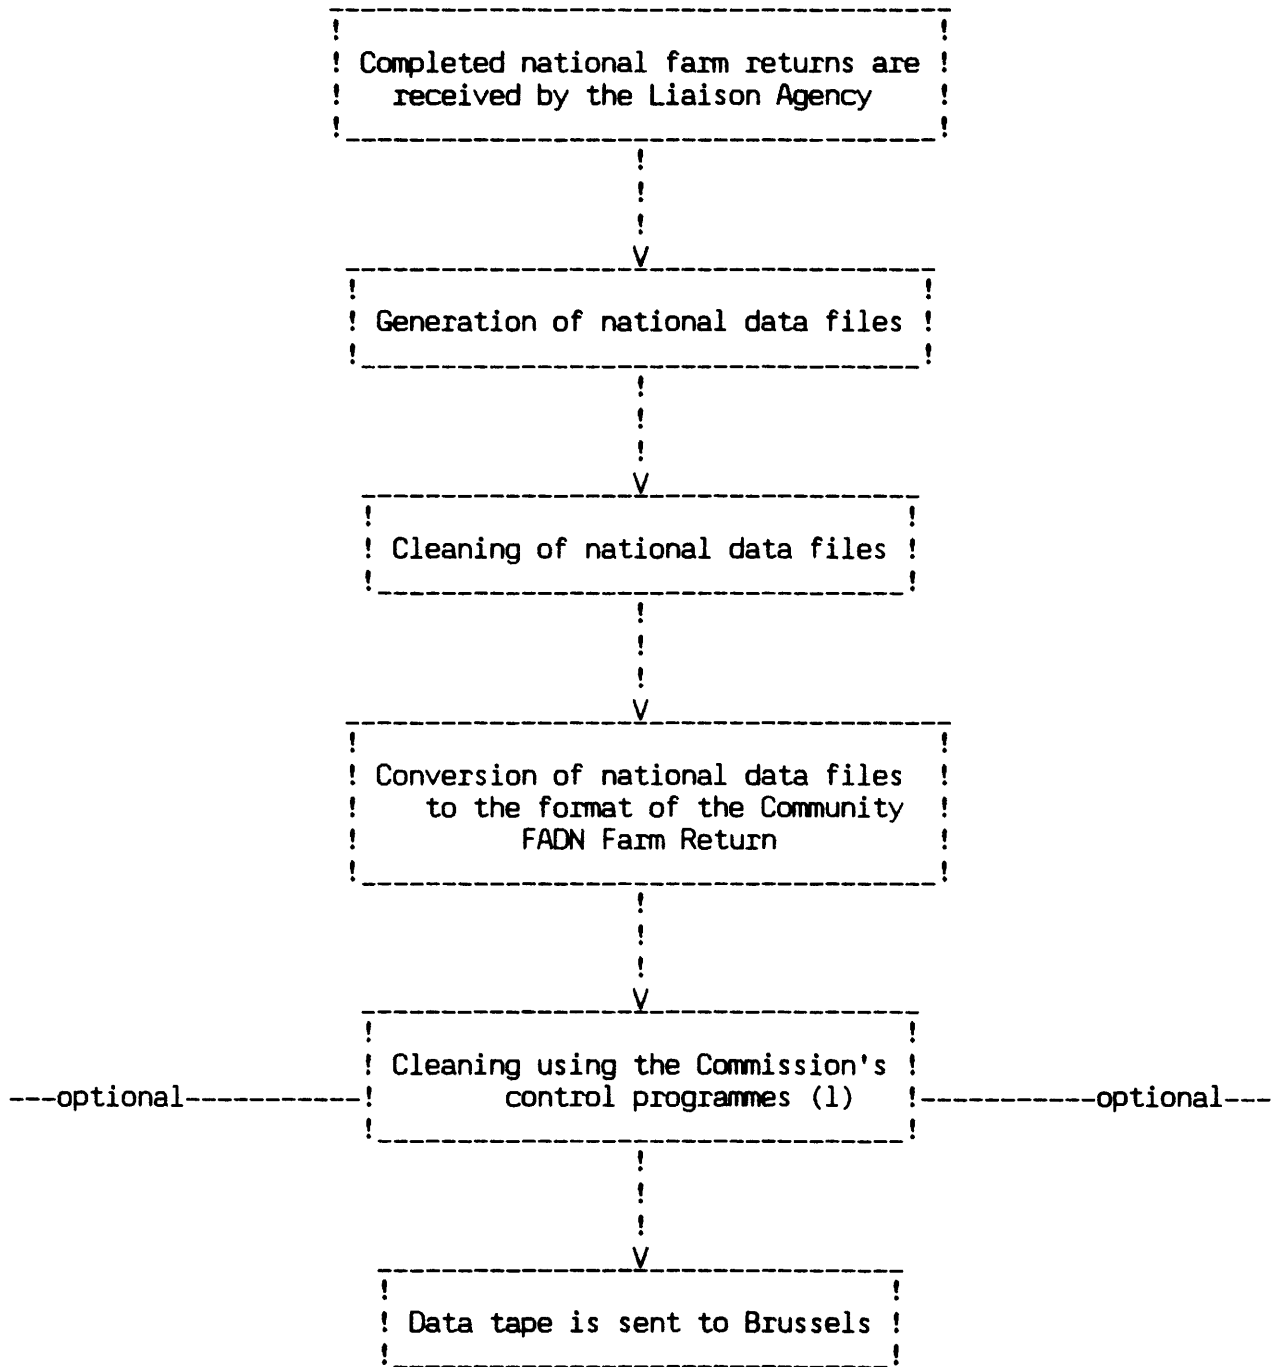

5.3.1 Quality control procedures at the level of the individual farm

i) Standard tests. The procedures followed by the Commission for ensuring the quality of data at farm level are shown in the upper half of Figure K. The first procedure is that of classification: all farms are classified according to the Community typology (see Section 3.3.4).

As detailed in Chapters 2 and 3, for farm classification Standard Gross Margins (SGMs) must be applied to each of the farm's enterprises. Farms must be classified by region, size and type before the data control programme can run. During this stage, farms may slip from the cell in which they were originally classified for selection purposes to another cell. Such a situation may arise because, for instance, the size of an enterprise may have changed between the time the farm was sampled and the end of the accounting year.

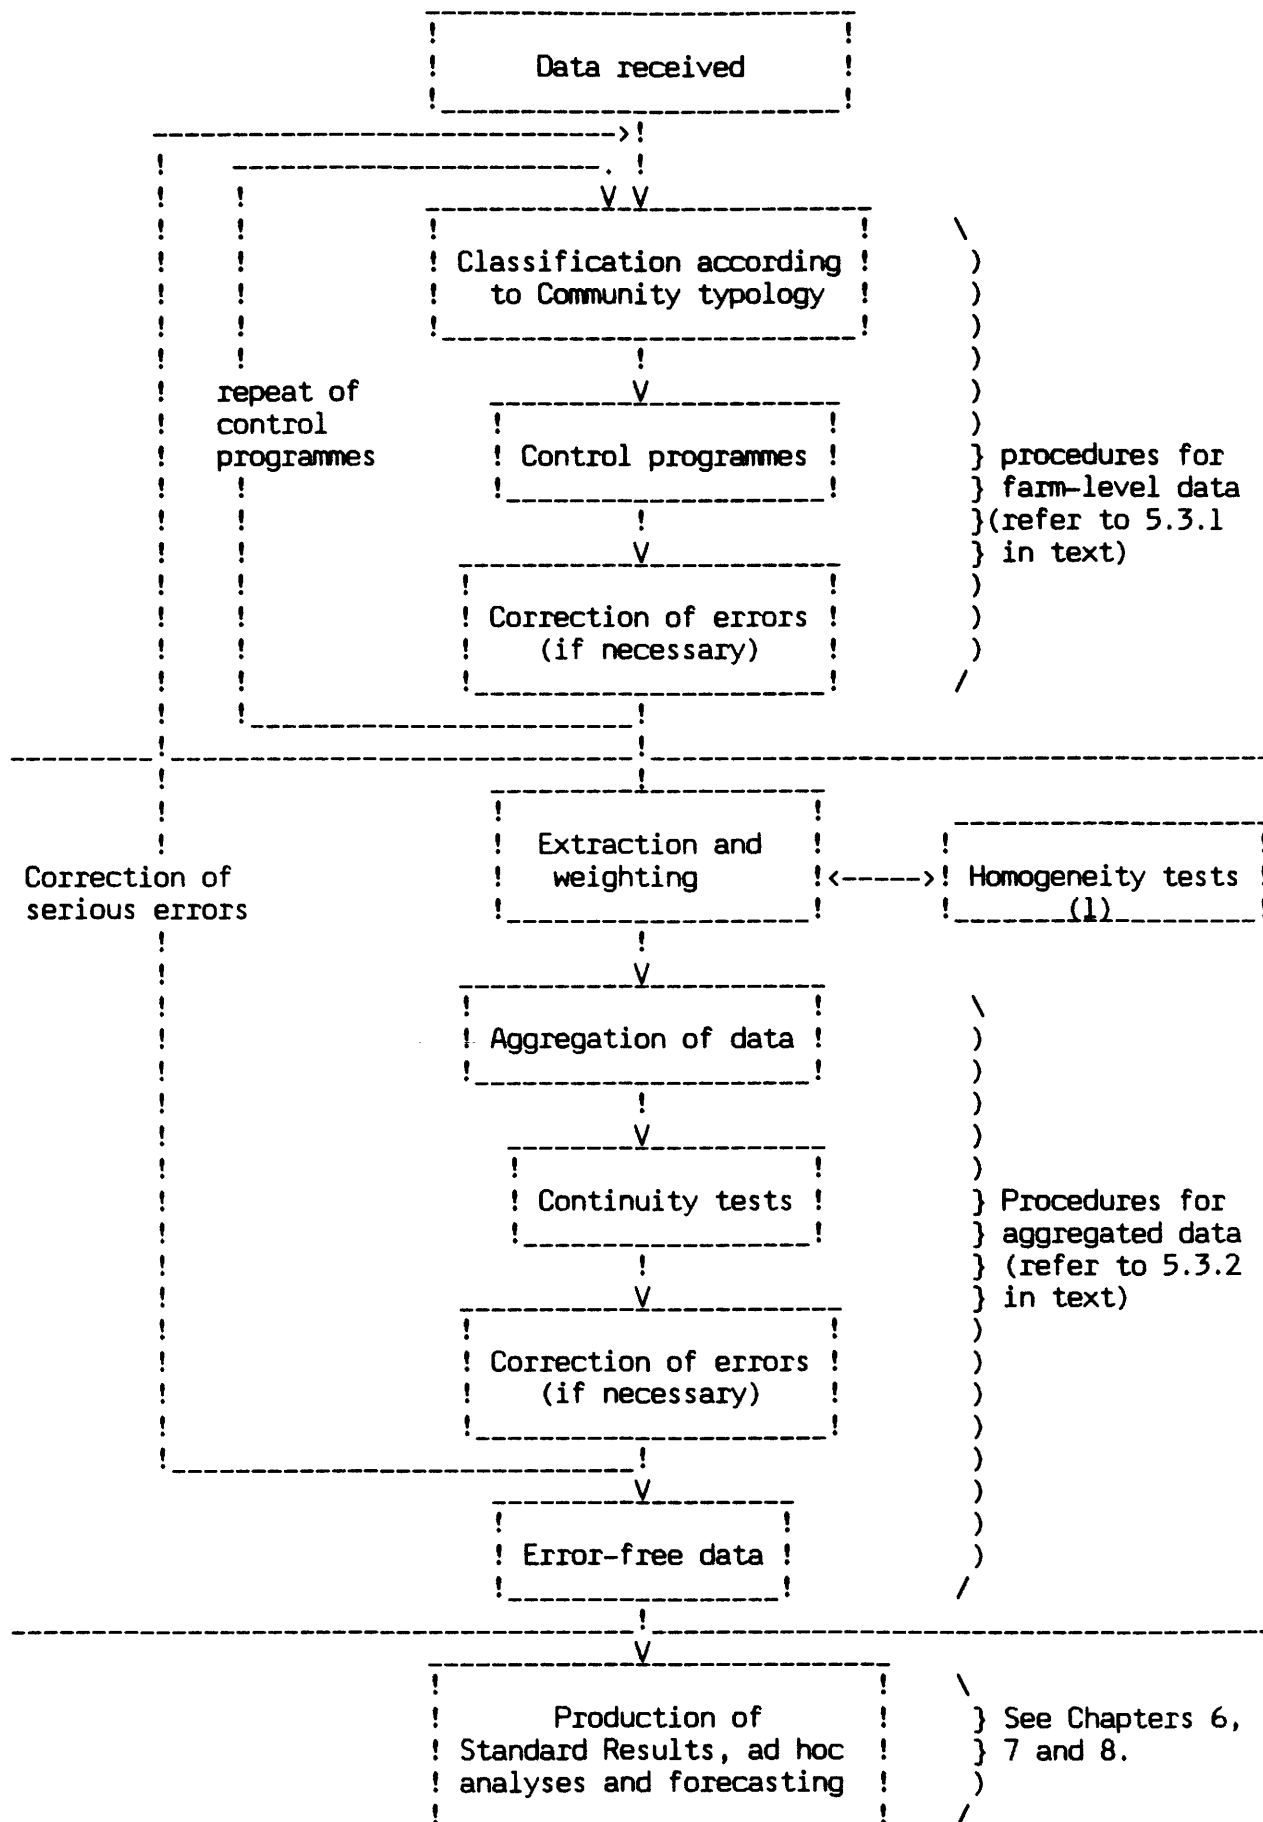

(1) OJ No L 263, 17.10.1977, p. 1.

Figure J: Quality control procedures followed by Liaison Agencies

(1) recommended by the Commission

Figure K Quality control procedures followed by the Commission

(1) Homogeneity tests are performed for some special applications (see 5.3.1).

The second procedure is the running of the control programmes. These consist of several hundred tests which search for and try to identify possible errors, inconsistent data and improbable values. Three levels of error are defined according to severity (see Annex IV for further details).

Errors can be of four types:

- a) Coding errors - due to operator's mistake
- b) Computational errors - due to mistakes in computer programmes
- c) Errors due to missing data \ due to mistakes by the office
- d) Unlikely values / completing the Farm Return

Type d) errors - unlikely values - are identified by likelihood tests which compare the value of a variable, as given in the Community FADN Farm Return, to the expected value. For instance, Liaison Agencies invariably have a good knowledge of crop yields in each region; a minimum and a maximum yield can thus be specified. The yield for each farm is compared to these expected limits. Those Farm Returns with values that fall outside the limits are then identified and examined.

Two different lists of errors are printed:

- a) For each test a print-out of those Farm Returns with errors or warnings. Table 22 is an example of such a print-out.

It enables accountants and programmers in Liaison Agencies to locate:

- errors that have arisen during the conversion of the national Farm Return to the Community FADN Farm Return.
- errors due to misinterpretation of headings in the Community FADN Farm Return.
- errors and omissions made during data collection.

- b) For each Farm Return, a print-out listing those tests which have located errors. Table 23 is an example of such a print-out. It enables corrections to be made to individual Farm Returns and also identifies those returns that have a large number of errors and that may thus be rejected from the sample.

The third procedure is the correction of errors. Farm Returns which need to be corrected are returned to the Liaison Agencies and may have to be referred back to the regional level or to the original accounting office. However, some Farm Returns may be replaced because, in certain cases, national samples are larger than those required by the Commission for FADN purposes and, rather than correcting a Farm Return, it may be easier for the national Liaison Agency to replace it with another from the Member State's own sample.

ii) Optional tests. In addition to the standard tests described above, the Commission may opt to run homogeneity tests. These tests help to create sub-samples that are appropriate for special analyses. They identify outliers - i.e. farms for which the value of one or more variables is significantly different from the mean value for the category to which the farm belongs. This may point to an error in data collection or data coding that was not found by the standard tests.

Some farms may be outliers for logical reasons. For instance, in some regions pig farms generally operate on a small area of land because the pigs are permanently housed. But, it may be that within a category of such farms there is one with an unusually large area of land because the pigs are 'free-range' (allowed to forage in the fields and housed only at night). Such a farm will be identified as an outlier by the appropriate homogeneity test. When it is examined, the farm's special character will be revealed.

5.3.2 Quality control procedures at the aggregate level.

The above section outlines the procedures applied by the Commission to individual farm data. When these have been completed, the procedures shown in the bottom half of Figure K are initiated. First the data are weighted and aggregated at the level of region, Member State, size class and type of farming. Continuity tests are then run. These compare the computed mean values of the standard set of variables⁽¹⁾ to the expected mean values, i.e. the mean values that would be expected on the basis of previous trends.

For example, if the average land area of farms has been steadily increasing over the last 5 years, then it would be reasonable, other things being equal, to expect farm area to continue to grow at a similar rate. Thus for the current accounting year, mean farm area can be predicted (X ha) and compared to the observed value (Y ha).

The continuity test then computes the percentage deviation between X and Y. If this exceeds a predetermined threshold, then the computer programme generates a message giving both the percentage deviation and the absolute deviation. The data are then examined to see if there is a logical explanation for the apparent abnormality. If not, the data are corrected at the level of the individual farm.

5.4 Timetable for quality control and calculation of results

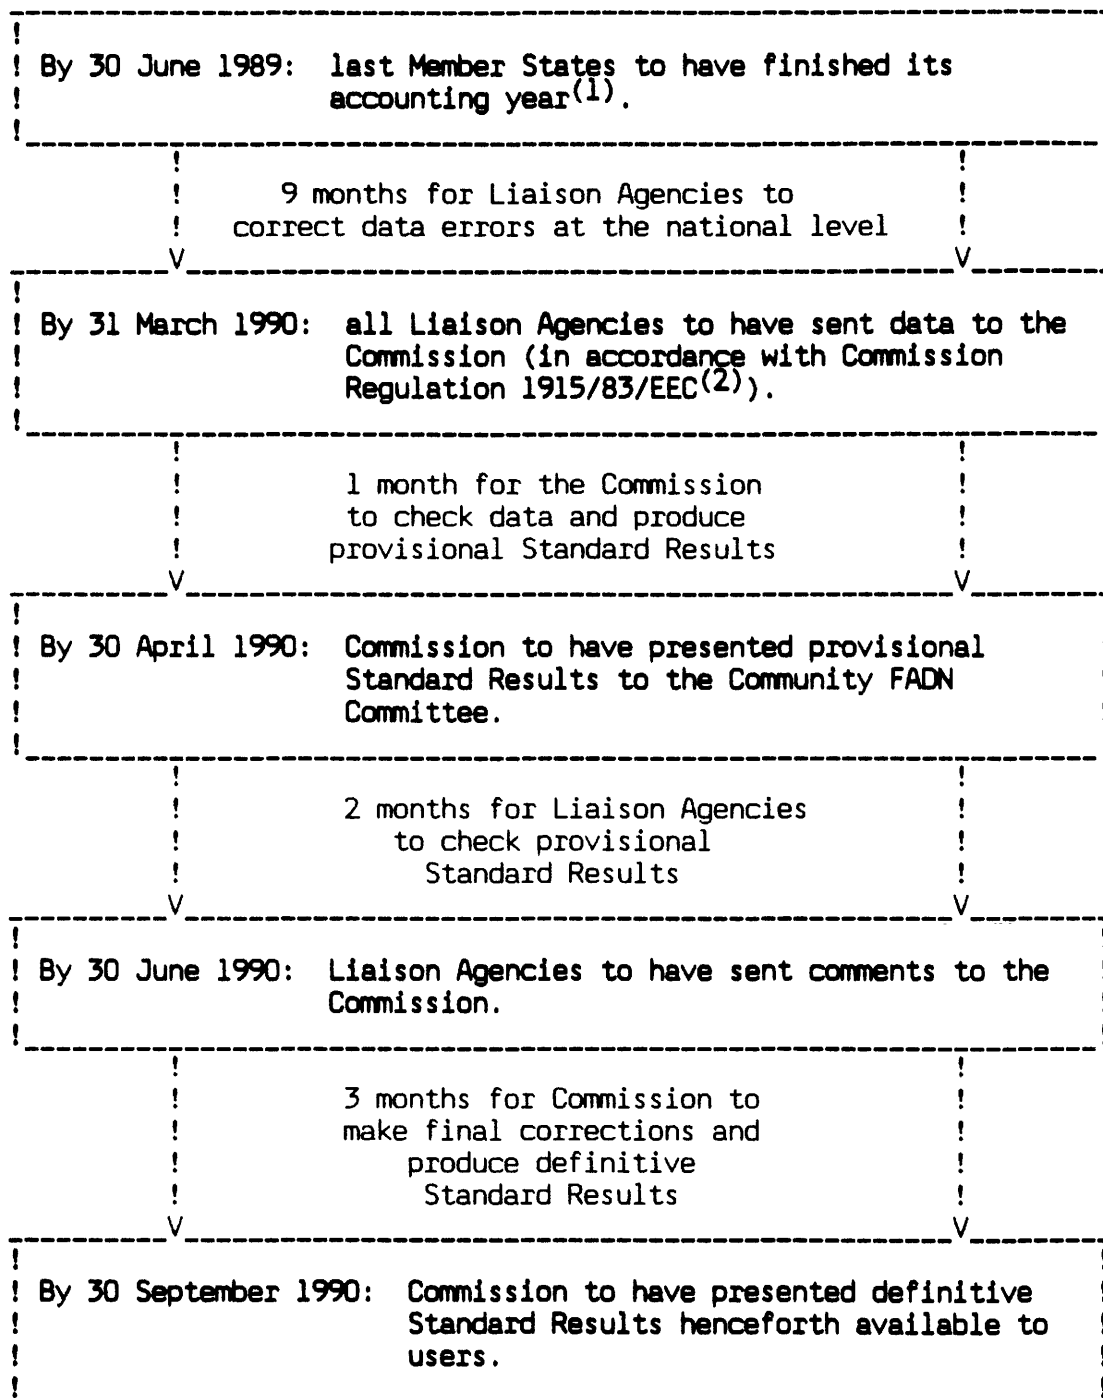

Once the data are accepted as error-free, the Commission can produce the Standard Results, perform other analyses and make forecasts (see Chapters 7 and 8).

The completion of all the procedures needed to produce the Standard Results should take no more than 15 months after an accounting year has finished (see Table 24). In practice, some national Liaison Agencies have not always been capable of respecting the timetable set out in the legislation. Consequently, there have been considerable delays in the publication of aggregates for the Community as a whole. It is hoped that this will improve in future.

Table 24 shows the timetable that should apply for results for the 1988/9 accounting year:

(1) See 7.1.2 for further information on the standard set of variables.

Table 24 Proposed 15-month timetable for the control of data and the production of Standard Results (accounting year 1988/9 is taken as an example)

Time required for all the above stages: 15 months

(1) as Figure E shows, most Member States finish the accounting year on 31 December. This means that data correction and the preparation of Standard Results can begin before the deadlines specified above.

(2) OJ No L 190, 14.07.1983.

6. THE WEIGHTING SYSTEM

6.1 The need for a weighting system

An individual weight is applied to each farm in the sample, this being calculated as the number of farms in the cell of the field of observation divided by the number of farms in the corresponding cell in the sample. A weighting system is used in the calculation of results to accommodate different sampling fractions.

6.2 Information on the field of observation

To calculate weighting factors it is necessary to have accurate and up-to-date knowledge concerning the field of observation. The Farm Structure Surveys (FSS), conducted biennially by the Statistical Office of the European Communities, and national surveys conducted by Liaison Agencies are used to derive the weighting factors. Since information on the field of observation is not available every year, the Commission uses the most recent information available.

6.3 The aggregation of cells

Every effort is made by Liaison Agencies to ensure that all categories of farms - that is, all cells that contain farms in the field of observation - are represented in the sample. However, the intended sample may not be attained and some cells may have no farms. Therefore such cells in the field of observation will not be represented in the sample.

From its knowledge of the field of observation and selection method, the Commission, assisted by the relevant Liaison Agency, is able to judge for which farm types cells in the sample may be empty. In such cases, the Commission aggregates farm types and size classes. Table 25 shows the types of farming and size classes that the Commission and the Liaison Agencies have agreed should be aggregated as a matter of routine. An example of the mechanics of aggregation is now given.

In the Community typology of agricultural holdings, two similar types of mixed livestock farms are distinguished: 71 (mixed livestock, mainly grazing livestock) and 72 (mixed livestock, mainly granivores). In some Member States there are a large number of both types of such farms in the field of observation and it can be expected that the cells representing these types of farming at the level of the sample will be full. But in other Member States - for instance Belgium and Denmark - there are comparatively few farms of each of these types.

There is thus a risk that one or other of these types will not be represented in the sample. To counter this risk, the two farm types are aggregated in order to represent a single broader farm type at a higher level in the typology: for instance, type of farming 71 and type of farming 72 would be aggregated to form one cell representing type of farming 7, as illustrated in Figure L.

As well as increasing the extent to which the field of observation is represented by the sample, aggregation also serves to reduce the standard error of the sampling means of variables for those types of farming that are grouped together. Thus if there are several types of farming with similar characteristics, these may be aggregated and treated as a single type.

6.4 Minimum weighting factors

As stated in 6.1, information on the field of observation is obtained from Farm Structure Surveys and from National Surveys. It may arise that according to the above sources of information, a particular cell at the level of the field of observation is empty. But at the level of the sample it may be that the same cell contains one or more farms.

This apparent anomaly is rare and is of lesser importance than the existence of empty cells described in 6.3. It can arise, for example, because in some cases the FSS is a sample survey producing results which are raised sample statistics. As a consequence there may be one or more farms in Cell X in reality but according to the raised samples of the FSS there are no such farms.

This means that it is impossible to calculate a weighting factor that reflects the real situation. From its knowledge of the situation in each Member State, the Commission applies a weighting factor of either 1 or 10. Figure M illustrates this situation and its resolution.

6.5 Maximum weighting factors

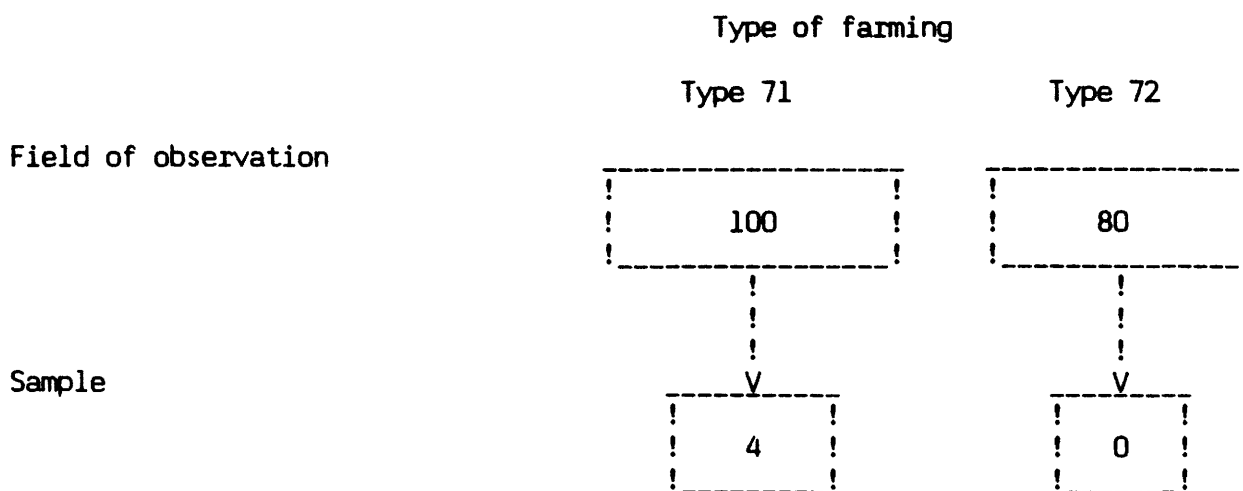

In the field of observation, some cells may contain a large number of farms. In contrast, at the level of the sample, the same cells may contain a very small number of farms. The reason for this may be that there are few farms willing to participate in the survey or that there is a high drop out rate during the course of the survey. The consequence is a low sampling fraction.

This may introduce some bias in the results for such cells, because the small number of farms in the sample may be atypical of the large number that they are supposed to represent.

To reduce possible distortion, a maximum weighting factor of 500 is applied to each farm in those cells with very low sampling fractions (and consequently high weighting factors). This means, in effect, that no sample farm can represent more than 500 farms in the field of observation. Figure N illustrates this, and shows how farms are lost from the field of observation.

The use of a maximum weighting factor is a short-term solution to this problem and has the disadvantage that it results in an artificial reduction in the field of observation represented by the sample. In the medium-term, the Commission hopes that low sampling fractions will be avoided when the Liaison Agencies have improved their selection methods.

Figure L Aggregation of cells - similar cells with one empty at sample level

Problem: Two similar types of farming are distinguished at the level of the field of observation. Type 71 is "mixed livestock, mainly grazing livestock" and type 72 is "mixed livestock, mainly granivores". A problem arises because farms of the latter type are not represented in the sample.

Solution: Because the two types of farming are similar, the two cells can be aggregated to form a single cell which represents type of farming 7 "mixed livestock holdings".

Table 25 Those types of farming(1) and size classes that are aggregated for the calculation of weighting factors (2)

Member States	Types of farming aggregated into a single class	Size classes aggregated into a single class
Belgi(qu)e	(11 + 12 + 60) (2011 + 2012 + 2013 + 203) (2021 + 2022 + 2023) (502 + 503), (71 + 72) (811 + 812 + 82), (813 + 814)	none
Danmark	(31 + 32 + 33 + 34) (42 + 43 + 44), (502 + 503), (71 + 72)	none

Portugal	(20 + 601), (32 + 33 + 34) (41 + 42 + 43 + 44 + 71 + 72) (602 + 603 + 604 + 605 + 606), (81 + 82)	VII + VIII + IX
United Kingdom	(31 + 32 + 33 + 34), (42 + 43) (50 + 821), (71 + 72), (811 + 812) (813 + 814 + 822 + 823)	VIII + IX for regions 421 and 441, for other regions - none

(1) For an explanation of the codes, see Commission Decision 85/377/EEC of 7 June 1985, OJ No L 220, 17.08.1985, p. 1.

(2) This aggregation scheme was first used for the 1983/4 accounting year.

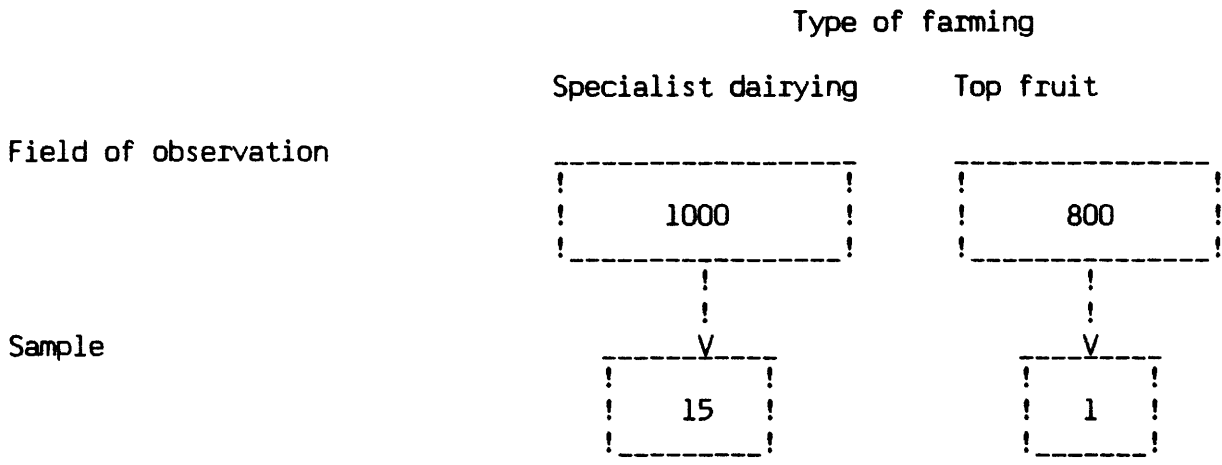

Figure M The problem of empty cells in the field of observation

Problem: According to the FSS/National Survey there are no farms in Cell X in the field of observation. However, in the sample there is one farm in this cell. It is therefore impossible to calculate a weighting factor - i.e. to know how many farms the single sample farm actually represents.

Solution: A minimum weight is fixed, in general, at 1. This assumes that the farm that has fallen into the sample is the only one of its category in the field of observation.

Figure N The problem of low sampling fractions and dissimilar cells

Problem: Specialist dairy farms are well represented and do not constitute a problem. However, top fruit farms are poorly represented. If this sample farm happens to be atypical of the field of observation, then the high weighting factor (in this case 800) will cause a serious distortion. Top fruit farms cannot be aggregated with specialist dairy farms because the two types of farms are very dissimilar.

Solution: Apply a maximum weighting factor of 500. This means that the one sample farm represents 500 top fruit farms in the field of observation. The other 300 farms are thus not included in the field of observation represented by the sample. As a result, the sample represents 5/8 of the farms in the field of observation.

7. STANDARD RESULTS AND AD HOC ANALYSES

7.1 Standard Results

7.1.1 What are Standard Results?

The Standard Results are a set of statistics, computed from the Farm Returns, that are periodically produced and published by the Commission. They describe in considerable detail the financial situation of farmers by different groups throughout the Community. An example of Standard Results for 1986/7 is given in Table 26 (pages 62 to 65). As well as producing Standard Results, the unit responsible for FADN within the Commission performs specific economic analyses. This second activity is described in 7.2.

7.1.2 The definition of variables

The Commission has defined each variable in the Standard Results, attempting to ensure a close correspondence between the definitions of its own variables and those of other organisations producing agricultural statistics. The list of definitions is available in French and English as a separate publication (RI/CC/882 rev. 3)

Figures P, Q and R (pages 66 to 68) show how the main income and capital variables are derived.

Table 27 (page 70) gives the coefficients that are used to convert livestock species and classes to a common unit - the Livestock Unit (LU).

7.1.3 Financial variables expressed in ECU

All results are given in European Currency Units (ECU). This enables the results for individual Member States to be aggregated to the level of the Community and the results of two or more Member States to be compared.

A conversion rate (national currency --> ECU) is calculated for each Member State for each FADN accounting year and is the average of the monthly exchange rates. These monthly exchange rates are calculated by the Statistical Office of the European Communities (Eurostat) and made available as part of the CRONOS data bank. Table 28 (page 71) gives the exchange rates used by the Commission for FADN purposes for the accounting years 1983/4 to 1986/7.

7.1.4 Standard groupings

Table 26 gives an example of Standard Results at the level of Member State. The unit responsible for FADN within the Commission has established a set of standard groupings for which the Standard Results are computed, as follows:

- i) 9 different types of farming at the level of the Community which are shown in Table 29 (page 71). An example of the Standard Results grouped according to these types of farming is given in Table 31 (page 73).
- ii) regions - Table 30 (page 72) gives an example for the regions of Portugal. Figure C (page 11) gives a map of the regions used.

Figure P The derivation of income indicators I

(1) farm production used as inputs to other production activities

(2) including farm use

(3) equivalent to Gross Added Value

(4) on the basis of replacement value

Figure 0 The derivation of income indicators II

sales of assets (1)	closing valuation of debts	depreciation	starter stock of agricultural products	correction of livestock valuation	Family Farm Income
------------------------	-------------------------------	--------------	----------------------------------------------	-----------------------------------------	--------------------

Investments (1)	opening valuation of debts	final stock of agricultural products	Cash-flow (2)
--------------------	-------------------------------	--------------------------------------------	---------------

- (1) land, buildings, machinery and equipment, circulating capital
 Cash-flow = receipts - expenses of the accounting year.
 = sales of products + miscellaneous receipts + sales of livestock + subsidies + VAT balance
 - all real costs - purchases of livestock - taxes
 ± balance of operations on assets (including land)
 ± balance of refunds of loans and new debts.

- iii) 6 different economic size classes, at the level of the Community and for each Member State (Table 32 - page 74)
- iv) different land area classes, at the level of the Community and for each Member State. Farms practising intensive livestock production and horticulture are excluded from this classification (Table 33 - page 75)
- v) different income classes, at the level of the Community and for each Member State (Table 34 - page 76)

7.1.5 Selective printing

Values for a total of 110 variables can be computed. This set is known as "Level I" and a reduced set of 34 variables, known as "Level II", is often used.

In order to maintain confidentiality of information, the Commission does not publish results for classes with fewer than 10 sample farms.

7.2 The execution of ad hoc analyses

In addition to producing Standard Results, the unit responsible for FADN within the Commission performs specific consultations. These are requested by various units, divisions and directorates of the Commission and other Community institutions. Such consultations are undertaken for those responsible for the management of agricultural markets, those concerned with the structure of agriculture and those engaged in the design of policy.

The demand for ad hoc studies is continually growing and has included the following topics:

- the economics of wine production
- the economics of farming in Less Favoured Areas
- the production costs of cereals
- the incomes of farmers by age and level of debt
- net margins of dairy production
- the effects of the set-aside policy
- the costs of milk and beef production
- the use of fertilizers in dairying

Table 27 Coefficients used to convert species and classes of livestock to Livestock Units (LU)

Code in Table D of Farm Return ⁽¹⁾	Class or species	No. of livestock in this class equal to 1 LU
22	Equines	0.6
23	Calves for fattening	0.4
24	Other cattle < 1 year ⁽²⁾	0.4
25	Male cattle 1 - <2 years	0.6
26	Female cattle 1 - <2 years	0.6
27	Male cattle ≥ 2 years	1.0
28	Breeding heifers	0.8
29	Heifers for fattening	0.8
30	Dairy cows	1.0
31	Cull dairy cows	1.0
32	Other cows	0.8
40	Ewes	0.1
41	Other sheep	0.1
42	Goats	0.1
43	Piglets	0.027
44	Breeding sows	0.5
45	Pigs for fattening	0.3
46	Other pigs	0.3
47	Table chickens	0.007
48	Laying hens	0.014
49	Other poultry	0.03
50	Other animals	no LU applied

(1) Ref. Commission Regulation 2237/77/EEC of 23 September 1977 (OJ No L 263, 17.10.1977 p. 1) including amendments before July 1987.

(2) Buffalo are included in the appropriate category of cattle.

Table 28 Mean rates applied for FADN purposes to convert national currencies to ECU

1 ECU equals the following units of national currency:

Member State	1983/4	1984/5	1985/6	1986/7

8. The RICA FORECASTING SYSTEM (RFS)

8.1 Objectives

The RFS has two objectives:

- i) to bring the Standard Results up to date. Such an exercise is known as an 'updating' and is necessary because there is a lag of normally two years between the reference year and the publication of results (see 8.2).
- ii) to enable the Commission to make short-term forecasts and to simulate scenarios. For instance, if the prices of particular inputs increase by X%, then what would be the expected consequences for, say, farmers' income? As another example, if the price of a product changes, what might be the expected effects on farmers' income? Such exercises are considered as 'ad hoc' simulations and are discussed in 8.3.

8.2 Standard updates

8.2.1 How is the updating done?

A questionnaire is sent to Liaison Agencies each year, asking them for information on changes in prices and quantities of farm inputs and outputs in the latest accounting year. These values are introduced as coefficients into the model to calculate changes for a range of variables (the most important being income) for each type of farming. The example on page 78 illustrates the procedure.

8.2.2 Sequence of standard updating exercises

During the year, several updating exercises are done. A first, provisional estimate of income indicators for the current accounting year is made at the beginning of December. Further estimates are made as more information becomes available.

8.2.3 Example of output

Table 35 shows the results of an updating exercise. It gives the percentage change in Net Farm Value Added per Annual Work Unit between 1985/6 and 1986/7.

8.3 Ad hoc updates

The RFS enables the Commission to make projections from the present and to set up and explore scenarios. In this way, the RFS can be used as a model of the financial and economic situation of farms in the Community.

8.4 Limitations of the RFS system: the RFS II Farm Model

The basic RFS model does not take into account substitution which may occur between different agricultural enterprises: for example, a farmer may expand wheat production by reducing forrage-based activities. To take account of changes of this type, a more sophisticated model - the RFS II Farm Model - is under development.

EXAMPLE OF UPDATING

Suppose that the following information is known for year X for a particular farm. Such information will have been derived from the Farm Return:

	Wheat production	Wheat price	Cost of inputs
Year X	5 t	100 ECU/t	300 ECU/ha

From the above, it is possible to compute the farmer's gross output per hectare from growing wheat and his net value added per hectare. Gross output per hectare is the product of wheat production per hectare and price per tonne, i.e. $5 \times 100 = 500$ ECU/ha. Net value added per hectare is the difference between gross output and costs of inputs, i.e. $500 - 200 = 300$ ECU/ha. These figures relate to Year X.

The Liaison Agency supplies its latest estimates, on a national basis, of the percentage change between years X and Y in wheat production, wheat prices and the value of inputs. Suppose these are as follows:

	Wheat production	Wheat price	Cost of inputs
% change			
Year X to Year Y	5 % increase	2 % increase	4 % increase

The three variables in the data base are now updated as follows :

	Wheat production	Wheat price	Cost of inputs
Year Y	5.25 t	102 ECU/t	312 ECU/ha

It is now possible to calculate the percentage increase in gross output and net value added as shown below:

	Gross output (ECU/ha)	Costs of inputs (ECU/ha)	Net Value Added (ECU/ha)
Year X	500	300	200
Year Y	535.5	312	223.5
% change	7.1% increase	4% increase	11.75% increase

Table 35 An example of a forecasting exercise using RFS: the percentage change in Net Value Added per Annual Work Unit from 1986 to 1987 in real terms.

ANNEX II

FADN Legislation

List of instruments in force on 1 October, 1986

1. Creation of the Farm Accountancy Data Network

- Council Regulation No 79/65/EEC⁽¹⁾ of 15 June 1965 setting up a network for the collection of accountancy data on the incomes and business operation of agricultural holdings in the European Economic Community.

OJ No 109, 23.06.1965

amended by:

- . Regulation (EEC) No 2835/72 of 29 December 1972

OJ No L 298, 31.12.1972

- . Council Decision of 1 January 1973 adjusting the instruments concerning the accession of the new Member States to the European Communities.

OJ No L 2, 01.01.1973

- . Regulation (EEC) No 2910/73 of 23 October 1973

OJ No L 299, 27.10.1973

- . Council Regulation (EEC) No 2143/81 of 27 July 1981

OJ No L 210, 30.07.1981

- . Act concerning the conditions of accession of the Hellenic Republic and the adjustments to the Treaties.

OJ No L 291, 19.11.1979

- . Documents concerning the accession of the Kingdom of Spain and the Portuguese Republic to the European Communities.

OJ No L 302, 15.11.1985

- . Regulation (EEC) No 3123/85 of 6 November 1985

OJ No L 297 09.11.1985

- . Regulation (EEC) No 3644/85 of 19 December 1985

OJ No L 348, 24.12.1985

(1) The texts of these legal instruments are given in:
CEC - FADN (1987)
Farm Accountancy Data Network: Handbook of legislation instructions, notes for guidance. Revision March 1987. Section II: The Legislation. Document.

- . Regulation (EEC) No 3768/85 of 20 December 1985
OJ No L 362, 31.12.1985
- . Regulation (EEC) No 1986/87 of 7 July 1987
OJ No L 188, 08.07.1987

2. Selection of returning holdings

- Regulation (EEC) No 1859/82⁽¹⁾ of 12 July 1982 concerning the selection of returning holdings for the purpose of determining incomes of agricultural holdings.
This Regulation repeals Regulation No 91/66/EEC of 29 June 1966 (OJ No L 21, 04.07.1966) and the Regulations amending it.
OJ No L 205, 13.07.1982

amended by:

- . Regulation (EEC) No 13/84 of 4 January 1984
OJ No L 3, 05.01.1984
- . Regulation (EEC) No 1561/84 of 5 June 1984
OJ No L 150, 06.06.1984
- . Regulation (EEC) No 3368/84 of 30 November 1984
OJ No L 313, 01.12.1984
- . Regulation (EEC) No 3122/85 of 6 November 1985
OJ No L 297, 09.11.1985
- . Regulation (EEC) No 3548/85 of 16 December 1985
OJ No L 338, 17.12.1985

3. Collection, verification and forwarding of accountancy data

- Commission Regulation (EEC) No 1915/83⁽¹⁾ of 13 July 1983 on certain detailed implementing rules concerning the keeping of accounts for the purpose of determining the incomes of agricultural holdings.
OJ No L 190, 14.07.1983

(1) The texts of these legal instruments are given in:
CEC - FADN (1987)
Farm Accountancy Data Network: Handbook of legislation instructions,
notes for guidance. Revision March 1987. Section II: The Legislation.
Document.

4. **The Farm Return**

- Commission Regulation (EEC) No 2237/77 of 23 September 1977 on the form of Farm Return to be used for the purpose of the determining incomes of agricultural holdings.

OJ No L 263, 17.10.1977

amended by:

- . Regulation (EEC) No 600/79 of 29.03.1979

OJ No L 78, 30.03.1979

- . Regulation (EEC) No 3272/82 of 06.12.1982

OJ No L 347, 07.12.1982

- . Regulation (EEC) No 3123/85 of 06.11.1985

OJ No L 297, 09.11.1985

5. **The Community typology for agricultural holdings**

- Commission Decision 78/463/EEC of 7 April 1978 establishing a Community typology for agricultural holdings.

OJ No L 148, 05.06.1978

amended by:

- . Commission Decision 84/260/EEC of 29 February 1984

OJ No L 128, 14.05.1984

- . Commission Decision 84/542/EEC of 11 October 1984

OJ No L 293, 10.11.1984

- . Commission Decision 95/977/EEC of 7 June 1985

OJ No L 220, 17.08.1985

6. **The keeping of accounts in connection with the improvement of the efficiency of agricultural structure**

- . Council Regulation (EEC) No 797/85⁽¹⁾ of 12 April 1985 on improving the efficiency of agricultural structures.

OJ No L 93, 30.03.1985

(1) The texts of these legal instruments are given in:
CEC - FADN (1987)
Farm Accountancy Data Network: Handbook of legislation instructions,
notes for guidance. Revision March 1987. Section II: The Legislation.
Document.

ANNEX IV

TEST TYPES I AND II

Type 1 tests : leading to the rejection of the Farm Return
unless corrections are made

Test No	Purpose of test
1.01	Farm Returns bearing the same number
1.02 and 1.03	Computing errors rendering the recording useless
1.05	Less-favoured area codes
1.06	Table K (production) blank
1.10	The FADN district code is unknown
2.04	It is not the correct accounting year
3.01, 3.02, 37.02	Recording error in respect of area (Tables B and K)
5.00	Non-coherence of Table C (labour)
9.00	Non-coherence of Table D (livestock)
11.00	Livestock products (Table K) without livestock in (Table D)
26.00	Non-coherence of Table G (capital)
33.00	Non-coherence of Table H (debts)
34.00	Non-coherence of Table I (VAT)
35.00	Non-coherence of Table J (subsidies)
36.01	Product code unknown in Table K (production)
36.02	Type of crop unknown in Table K (production)
36.07	Crop in respect of area in Table K
36.08	Error in respect of area for crops in Table K
37.00	Non-coherence in Table K (production) among total, sub-total and detail headings
43.02	lack of sales

**Type 2 tests : the correction of errors spotted is essential,
but exceptions are possible
(to be discussed with the Member States)**

N° of test	Purpose of test
1.08	Holding not within FADN field
1.09 and 36.06	Farm Return with negative values
3.03. and 3.07	Error in respect of land and buildings
3.04	Error in respect of rental value
3.05	Absence of rent paid
3.08	Rent paid without rented area
3.10,20.01,20.02,43.02	"Aberrant" level of activity for a commercial farm
8.03	Error in respect of wages paid
10.00	Non-consistency between Tables D and E (livestock, livestock purchases and sales)
13.00	Average livestock number is aberrant
20.03 to 20.10)
21.01 to 21.03)
22.01) Non-consistency between costs (Table F)
23.01) and farming activities
24.01)
20.06	Absence of wages paid
21.03	Absence of interest paid
21.06	Error of "missing value" code for interest paid
21.07 and 21.08	Error of "missing value" code for debts
27.01	Absence of depreciation
27.12 to 27.17	Error of "missing value" code in Table G (capital)
31.01 to 31.03	Holding without machinery or equipment
32.01	Surprising level of debts
36.04 to 36.06	Non-coherence of Table K (production)
42.11	Livestock under contract in Table K (production) without average in Table D (livestock)

ANNEX V

INDEX

A

accounting years 5, 7, 18-20, 39, 47, 53, 54, 58, 61, 67, 68, 77, 91
ad hoc analyses 49, 69, 77
aggregation of cells 52, 53, 55-61
assets 67, 68

B

bias 4, 56

C

capital indicators 61, 68
cash-flow 1, 66
