WORKING PAPER

Potential available for research work and basic design
information in collaboration with European
industries and organizations

Areas of activity
Competences acquired
Experimental facilities
Possible areas of application
Possible interested industries

February 1969
The Establishment Ispra of the CCR employs presently about 1800 persons, among whom about 1360 scientists and technicians.

The most important fact of the research carried out at Ispra during the last eight years has been integrated in the development of large reactor development projects, namely ORGEL (heavy water moderated - organic cooled reactor), fast neutron sodium cooled reactors, light water reactors. Furthermore, it includes moderate but well coordinated research activities in some areas such as neutron physics, solid state physics, direct conversion, biology, radiation chemistry.

The purpose of the present document is to provide national projects, industries or other organizations with information on the research potential available in Ispra. Since the existing experimental facilities are of little value without adequate experienced personnel, the data were related to the activities of research units. For each team the information is condensed in 2 pages. Information is given on the following points:

- Short description of scope of work carried out so far or underway for each research unit and the characteristics of the experimental facilities available.

- Experience of the personnel and list of publications furnishing information on related studies.

This document actually represents a catalogue of possible utilizations. The indicated possible areas of application are given as examples without pretending completeness. It must be considered, that many groups with their installations can be employed without great difficulties in related research fields.

This paper will allow the interested organizations only a preliminary selection of possible utilizations. A confrontation of "clients" and scientists should in a later stage lead to the precise definition of the tasks to be carried out and the amount of people to be involved.

I) Test Reactors

I/1 ECO
I/2 Ispra I
I/3 Irradiation and Post Irradiation Tests
Area of activity
ECO (critical facility for heavy water moderated reactors).

Competence acquired

Experimental programme in the field of heavy water reactors, Buckling measurements of several fuel element types (U metal, UC, UO₂ with different cluster geometry and coolant) at different lattice pitches in the range from 18.8 to 30 cm. (progressive substitution and flux mapping methods). Detailed parameters measurements by foil activation technique in moderator and special fuel elements (ε, p, I.C.R., spectral indices, thermal flux fine structure, Doppler effect), burn-up measurements by fuel element oscillation, transfer function and reactivity measurements.

Experimental facilities

a) ECO - Zero power critical experiment
Max. power 1 kW, Max. thermal neutron flux 10⁹ n/cm²s
D₂O moderator (25 tons), natural uranium fuel (200 fuel elements), simulated organic coolant
Reactor tank: diameter 3m, height 4, 22 m
Bottom and side graphite reflector 0,9 m
Biological concrete shielding 1,7 m

b) Loop for heating and circulating liquids in pile (organic coolants up to 300°C and H₂O - D₂O up to 200°C).

c) High precision period meter, analog and digital reactivity meters for calibration of control and safety devices (from 10⁻² pcm to about 5000 pcm).

d) Fuel element oscillator for burn-up studies with irradiated fuel.

e) Sinusoidal reactivity oscillator for transfer function studies (from 10⁻³ to 20 Hz).

f) Pulsed source equipment for reactivity calibrations or high frequency pile modulation.

g) Equipments for β and γ
- automatic 8 channels unit for β counting
- automatic single channel for β, β-γ, γ-γ coincidence measurements
- 4 further special counting channels.

Possible areas of application
The reactor may be utilized for experiments in the field of reactor moderated with heavy water and cooled with heavy water, light water, organic liquids (fuel elements with various configuration and composition natural or slightly enriched Uranium, Pu-U and Th-U alloys e.a.).

See next page

EUR/C-IS/121/69 e
Experiments in hot conditions by means of a special loop measurements of void coefficient. Studies with irradiated fuel elements. (By the progressive substitution technique or by oscillation).

Area of activity
Reactor Ispra I

Competence acquired
Operation of Ispra I (5 MW heavy water cooled and moderated research reactor). Maintenance and improvement of the nuclear and non nuclear circuits and components of the whole plant. Operation of in-pile organic fluid loops.

Experimental facilities
- 2 organic liquid cooled in-pile loops (actually out of service), working temperature 300°C and 400°C, serving for irradiation of fissile or non fissile materials, flux 7. $10^{13}$ nvt and 3. $10^{13}$ nvt;
- Possibility of in core irradiation of rings with maximum diameter of 4 inches to 6 inches, flux 5. $10^{14}$ nvt to $10^{15}$ nvt;
- Possibility of irradiation in vertical irradiation channel of 3, 3 inches diameter, flux 3. $10^{13}$;
- 8 spectrometers, choppers or diffractometers for basic research on condensed matter using the reactor beam tubes;
- Possibility of use on reactor beam tubes from 4 to 12 inches diameter;
- Irradiations by fast neutrons in a large volume (4.5 m$^3$) irradiation chamber using the Euracos converter, fast flux = 2. $10^{10}$ nvt;
- Possibility of using a 12 by 12 inches vertical channel in the thermal column, flux 4. $10^{12}$ nvt;
- Production of radioisotope or irradiation of capsules for various researches.

* These facilities are operated by the reactor personnel; the other facilities are operated by the experimenters.
Possible areas of application

Technological and vasical research using reactor neutron or gamma/beta radiation. Radioisotope production.
Use of the experimental installation indicated under point 3).

Area of activity

Post-irradiation examinations of fuel and structural materials.

Competence acquired

Dismantling and examination of UC/SAP fuel rods and thermionic fuel capsules.

Experimental facilities

"Laboratoire de Moyenne Activité" with the possibility to perform the following operations:
- dismantling of fuel elements and capsules
- gamma-scanning
- puncture-test
- dimensional measurements
- determination of density
- determination of expansion coefficient (dilatometry)
- metallography
- hardness measurements
- mechanical properties (tensile test and impact test)
- post-irradiation annealing test.

Possible areas of application

Performance study of reactor materials.

Possible interested industries

Electrical utilities with nuclear power stations.
Reactor industry.

Area of activity

Packaging and transport of radioactive materials

Competence acquired

Several design studies, safety reports for approval by competent Authorities - structural, thermal, shielding, criticality (with TCR support), calculations, drawings and assessment - for type A, B, great source packagings and for capsules. Modifications, additions and transformations of road-vehicles for transport of radioactive materials. See references for details.

Experimental facilities

Facilities to test type A packaging for radioactive materials are available. Calculation on Cetis computers have been done for type B packaging.

Possible areas of applications

Design and development of transport packaging and vehicles for radioactive and/or dangerous materials according to existing regulations, even in collaboration with industries and national organisations.

Area of activity

Instrumentation for irradiation tests

Measurement of high temperatures and neutron flux.
Special types of welding and brazing (without flux)
Resistivity (at cryogenic and room temperatures)

Competence acquired

- Diffusion boundings of sheat of thermocouples and plugs of fuel elements
- Fabrication of composite thermocouples for high and medium temperatures
- Study of the insulation of various ceramics up to 1700°C (BeO-Al2O3)
- Flux detectors "Collectrons": fabrication, calibration, measuring devices
- Calibration of thermocouples up to 1700°C with three reference points (Gold, Antimcny, Nickel)
- Brazing without flux of current or refractory metals
- Special types of weldings: TIG - Microplasma - Resistance Welding
- Resistivity

Experimental facilities

- Precision electrical measuring apparatus
- Furnaces for calibrations up to 1750°C (in vacuum or hydrogen)
- Several welding facilities
- Resistivity bench with cryostat

Possible areas of application

- Measurement of high temperatures (up to 1700°C)
- Continuous measurement of neutron flux
- Bonding of refractory metals for high temperature experiments
- Physical properties of materials (Resistivity)

Possible interested industries

Space Industry - Motor Industry - Metallurgical Industry

II) PHYSICS

II/1 Reactor Physics
II/2 Solid State Physics
Area of activity

Theoretical dynamics in general, of nuclear reactor facilities in particular.

Competence acquired

Establishment and treatment of mathematical models for the time behaviour of every nuclear reactor type.
Nuclear part: More-point and more-energy group kinetics. Linear and nonlinear stability, LIAPUNOV theory. Pulsed reactor kinetics.
Direct and indirect nuclear accident analyses.
Design of reactor components by dynamical points of view.

Experimental facilities (disposable at Ispra computation center CETIS)

Analog computer PACE 231 R, 3 consoles approximately with 150 amplifiers and 60 multipliers.
Various important auxiliary components, e.g. SIOUX, a device for automatic scale change.
Digital computer IBM 7090.
Digital computer IBM 360/65.

Possible areas of application

Design calculations, both nuclear and thermohydraulic of fuel elements and coolant circuits. All dynamics and nuclear safety analyses.
Two-phase flow problems (theoretical). Plant automation.

Possible interested industries

All nuclear firms.

Area of activity
System dynamics.

Competence acquired
System identification and mathematical simulation; development and techniques and instruments of measurements; realization of control means and prototypes.

Typical realizations
Transfer function of nuclear reactors; noise analysis in nuclear systems; dynamic behaviour of pulsed reactors; direct spectral method of identification of linear systems; thermodynamics for a digital code for liquid-cooled multi-channel reactors; mathematical model of heat exchangers; analog simulation of the control system of Reactor Ispra I.
Automatic control system for Dragon Reactor (UKAEA); transfer function analyser; statistical dynamics analyser; high resolution Mössbauer effect analysers.
Pile oscillators; development and erection of mock-ups of liquid-rod shut-down systems; fast safety rod for a pulsed reactor; fluidic control system (for pneumatic oscillators, pneumatic driven irradiation facility, level control device).

Possible areas of application
Basic research, traditional industrial processes, nuclear plants, economical systems, bio-engineering.

Area of activity

Reactor dynamics studies.

Competence acquired

Development of numerical programmes for space and time dependent neutronic and for the thermohydraulics of the cooling channels with boiling and non boiling coolants. These are the series of the Codes COSTANZA in one and two dimensional geometry for the study of the normal operation and for the dynamics of accidents of intermediate gravity.

Problems of stability of the plant are studied with zero-dimensional digital codes and analogical methods.

Xenon stability is treated with the series of COSTANZA codes adapted for long term transient, and also analytical methods for non linear stability were studied.

Normal power excursions of pulsed fast reactors inclusive of Doppler and thermal expansion feed-backs.

Analysis of elastic vibrations induced by pulsing.

Tools

IBM 360/65 digital computer.
3 PACE Analog computers.

Possible areas of application

Stability and intermediate accidents for any type of thermal reactors and pulsed fast reactors.

The extension to the domain of power fast reactors is possible.

Remarks

An Information Center on space dependent dynamics is being organized at Ispra in order to collect, evaluate and distribute through regular bulletins and meetings, world-wide data and codes.

Area of activity
Nuclear Data

Competence acquired
Elaboration of scattering kernel models (hydrogen bound in organic molecules and water, crystalline model for carbon) for use in multigroup thermal codes. Development of simplified formulae for the evaluation of resonance integrals of U-238, Th-232 and U-235 in heterogeneous systems for use in multigroup cell calculations. Execution of resonance integral and Doppler effect measurements for uranium carbide rods. Analysis of cross-section formalisms for fissile and fertile nuclei in the resolved and unresolved energy region. Utilisation and development of standard libraries (GAM, GATHER etc.). Processing of nuclear data from ENDF-B files for use in Montecarlo codes. Assessment of experiments in ECO for the evaluation of integral nuclear data of plutonium in thermal systems and their interpretation. Studies of fission product chains and their representation in simplified schemes. Measurements of spectra and integral nuclear parameters (conversion ratio, Doppler coefficient of U-238 etc.) in fast spectra by activation, proton recoil, stilbene and Li\(^6\) - sandwich spectrometers (EURACOS).

Tools
IBM 360/65 digital computer - ECO, heavy water critical facility - EURACOS converter facility; analog and digital direct reactivity meter; counting equipment; calibration converter DG65.

Areas of application
Collection and elaboration of multigroup cross-section libraries for nuclear design and operation in thermal and fast systems. Documentation, analysis and execution of clean-geometry integral experiments. Reliability tests of cross-section libraries on clean integral experiments. Assessment of the influence of cross-section uncertainties on design parameters. Elaboration of standard sets of cross-section libraries. Nuclear safeguard evaluations.

Remarks
This activity is a part of the proposed INDAC (Integral Nuclear Data Center) activity.

Area of activity
Radiation Shielding

Competence acquired
Shield design methods and calculations: evaluation of bulk shields; radiation streaming through ducts and voids; heat deposition in reactor components; radiation damage in pressure vessels; activation of components. Development of computer programs for the calculation of neutron and gamma ray attenuation with the removal-diffusion theory (MAC-RAD, SABINE) and transport theory (BIGGI, CINNA); collection and evaluation of computer codes and nuclear data interesting in shielding applications.

Experimental investigations: Mock-up studies for specific shields; neutron dosimetry and spectrometry; assessment of design methods.

Tools
High flux converter EURACOS: Power: 1.5 KW, source strength $10^{14}$ n/sec; incident fast flux $2 \times 10^{10}$ n/cm$^2$-sec; IBM-computers 7090 and 360/65.

Possible areas of application
Shield design, heat deposit and radiation damage calculations for light, heavy water reactors, HTGR, fast reactors; Shield design for accelerators; Accessibility problems for activated reactor components, etc.; Shielding for spent fuel elements.

Remarks
It is foreseen to establish at Ispra a European Shielding Information Service (E.S.I.S.) with tasks similar to that of the R.S.I.C. operating in the U.S.A. The E.S.I.S. is intended to serve nuclear industries and organizations of the European Community.

Area of activity

Reactor safety analysis.

Competence acquired

Theory and calculation of reactor and plant safety; assessment of fission product dispersion resulting from hypothetical extreme accidents; criticality control of fissile materials on the basis of the different national regulations. In particular computer codes were developed and used for: reactor dynamics studies (COSTANZA, SOREX 1, DOPPELAS); associated thermodynamic calculations (EQUSTA); atmospheric diffusion of radioactivity (CLOUD).

Tools

IBM 360:65 digital computer.

Possible areas of application

Analysis of non-destructive accidental transients for: boiling water reactors; pebble bed reactors; heavy water reactors; light water ship propulsion reactors.
Analysis of Xenon spatial oscillations. Analysis of non destructive accidents in fast reactors. Site hazards evaluation following a maximum credible accident. Studies of the storage transport and handling of nuclear fuel.

Remarks

The "Protezione Sanitaria" and "Génie Radioactive" Services are contributing, together with T.C.R. to this activity.

Activity n°TI/1/g

**Area of activity**

Reactor cell calculations

**Competence acquired**

Development of analytical and numerical methods for the evaluation of collision probabilities in various geometries (codes SHOCK, PROCOPE). Elaboration, test and use of design lattice calculation schemes, based mainly on integral transport equation, for Uranium Thorium and Plutonium bearing systems, including fuel evolution and point reactivity curve as a function of burn-up and various geometries (rods, clusters)-(codes PLUTPARCO, RABBIT, PINOCCHIO, HEROIC). Development of refined calculation models to rigorously treat the resonance phenomena in heterogeneous systems (code PESTARD). Improvement of existing codes for resonance integral calculations to deal with coated particle fuel elements (code ZUT-CP). Use of one and two dimension $S_N$ (WDSH, DTF-IV, 2DXY) and Montecarlo cell codes (REP, MOCK-UP).

**Tools**

IBM 360/65 - IBM 7090 computers

**Areas of application**

Evaluation of core group constants in nuclear design and operation of thermal reactors; calculation of hyperfine distributions in fuel bundles; refined calculations of reactivity temperature coefficients. Extension to fast systems is in progress. Burn-up studies (isotopic and reactivity analyses).

**Remarks**

This activity is a part of a more general competence in the field of fuel burn-up analysis.

Area of activity

Reactor cell measurements

Competence acquired

Critical experiments, activation techniques for detailed parameter measurements and spectral indices as function of temperature, reactivity calibrations of critical assemblies by many different methods. Data processin programs for experiments with critical assemblies (about 20 unpublished data processing codes available). Turn up measurements with pile oscillator techniques. Operation experience with subcritical DPR assemblies operated with stationary and pulsed sources. Analysis methods based on 3 group heterogeneous methods in mono and dipol approximation for stationary and pulsed source operation (CANDU-IСС) in order to obtain the material buckling and the migration area anisotropy.

Tools

ECO reactor, fuel element oscillator, loop for hot channel experiments, several automatic and semiautomatic activity counting installations, pile reactivity calibration equipment, hot cell for mounting active fuel elements, uranium metal and uranium carbide fuel in form of rods. Subcritical facility EUR equipped with fully automatic scanners for global scans axially and radially and cell fine structure in moderator around each fuel element. Stationary and pulsed source analysis equipment, moderator heatable up to 900°C.

Areas of application

Experiments to test codes for nuclear design of reactors, participation or full charge of power start up experiments with trained persons and equipment.

EUR/C-12/1/69/e.
Area of activity
Reactor core calculations, fuel cycles analysis.

Competence acquired
Development, test and use of two and three-dimensional (of homogeneous and heterogeneous type) computer codes for reactor design, burn-up and fuel management calculations: MAFIA; (under contract with FIAT-ARS) SQUID, CONDOR, EREBUS, TRITON; (under contract with GAAA) TRIHET, HETROIS; ORACLE. Development test and use of burn-up computer codes for fuel cycles assessment for a continuous charge and discharge of the fuel: BACCHUS, MOGA, BACON. Fuel cycles analysis for High Temperature Gas Cooled Reactors, Heavy Water Moderated Organic or Water Moderated Organic or Water Cooled Reactors, Light Water Reactors: assessment of the once through and of the Plutonium recycle schemes for Uranium fuelled reactors; assessment of the full recycle and of the segregation scheme for Thorium fuelled reactors.

Tools
IBM 360/65 digital computer.

Possible areas of application
Development of calculation methods for design and operation of power thermal reactors. Extension to fast reactors is possible. Comparison and assessment of the various possible fuel cycle schemes for a given reactor type. Comparison of different reactor types, on the basis of their fuel utilization, in view of power reactors strategy studies.

Remarks
This activity is a part of a more general competence in the field of the fuel burn-up analysis.

Area of activity

Competence acquired

Experimental and theoretical knowledge of X-ray dynamical diffraction phenomena. Experience in techniques: a) for X-ray diffraction topography, b) for quantitative measurements of X-ray diffracted intensities.

Experimental facilities

X-ray diffraction equipment (generator, tubes and geniometer).

Possible areas of application

Study of dislocations, segregation and precipitation in semiconductor crystals. Examination of diffusion induced dislocation patterns in semiconductor junctions.

Area of activity

Magnetic Resonance Spectroscopy.

Competence acquired

- High-resolution NMR spectroscopy
- Electron spin resonance
- Relaxation and double resonance spectroscopy.

Experimental facilities

- High-resolution NMR spectrometers at 60 and 100 MHz
- Electron spin resonance spectrometers
- r.f. pulse spectrometer at 4, 5, 15 and 48 MHz
- double resonance spectrometers
- liquid helium facilities

Possible areas of application

Structure of matter, molecular motions

Possible interested industries

Chemical industry

Area of activity
Investigations needed for the design of prototype fuel elements and their final realisation

Competence acquired
Design study and realisation of fuel elements applied for physical measurements in ECO and ESSOR

Experimental facilities
- Design office
- Mechanical workshop for the manufacture of structural elements
- Workshop for the manufacture of fuel pins
- Fuel elements and models
- Other facilities: vacuum furnaces of big dimensions, hydraulical press

Possible areas of application
Design study and construction of fuel pins, fuel elements
Area of activity

Study and development of nuclear reactor components
- design of nuclear reactor channels, of thermal insulation for concrete pressure vessels and of fuel handling devices
- design of a space reactor

Competence acquired
- Design and fabrication of an organic loop for in pile experiments
- Design and fabrication of experimental channels for the ESSOR reactor
- Lay out studies of small thermionic reactors
- Development of integrated space power plant (100 kWe)
- Design and testing of remote handle tube closure
- Measurements of thermal characteristics of materials

Experimental facilities
- Experimental set-up for testing the behaviour of a remote handle tube closure
- Mock-up to test insulation and lining materials under temperature and pressure (300°C, 100 atm)
- High temperature, high vacuum equipment
- Laboratory of thermometry

Possible areas of application
- Nuclear vessels, core of piles
- Pressure tube reactors
- Concrete pressure vessels
- Thermal characteristics of refractory and of insulating materials.

Possible interested industries
Nuclear Industry.

Area of activity

Calculation and design of structures subject to dynamic loads

Competence acquired

Calculation of strain and stress in complex structures which are subject to the following loads:
- pulsating forces and/or displacements
- shock

Experimental facilities

Vibration and acceleration measuring and analysing equipment

Possible areas of application

Calculation and design under the special view of dynamic loading of the following devices:
- foundations, lifting appliance, metallic framework in general, shells etc.
- foundations, framework, protection walls against fragments, shock absorbers as honey-comb structures, spring configurations, hydraulic and pneumatic devices etc.

Area of activity
Calculation and design of fast rotating equipment

Competence acquired
Calculation of flexional, torsional, and axial critical velocities of peculiar configurations, including special effects as gyroscopic, shear and processional effects. Stress analyses within the rotating bodies with special regard to stress concentrations. Application of high velocity bearings. Experimental verification of the systems.

Experimental facilities
Vibration measuring and analysing equipment
Testing pit for fast running machines (under project)

Possible areas of application
Mechanical design of any kind of fast running equipment with high circumferential velocities as p. ex.: Neutron-choppers, centrifuges, angular decoders etc.

Area of activity

Fluid flow and heat transfer studies for thermal design of nuclear fuel elements (rod assemblies and other complex geometries), cooled by fluids in single phase flow.

Competence acquired

The competence acquired has its origin in thermal design studies for ORGEL and SORA fuel elements (bundles made up of finned or smooth rods) and in basic fluid flow and heat transfer studies in rod bundles. The following aspects were dealt with: development of calculation models, distribution of local coolant velocities and subchannel flow rates, coolant mixing, rod bundle temperature distributions, entrance effects.

Experimental facilities

Low pressure water circuit and laboratory facilities.

Possible areas of application

Thermal design of:
- fast-neutron reactor fuel rod assemblies
- compact rod-bundle fuel elements for space power systems
- compact rod-bundle fuel elements for water (heavy or light) cooled reactors.

Activity No.: III/2/b

Area of activity

Boiling water heat transfer in the pressure range up to 250 bar.

Competence acquired

Experimental facilities

High pressure water loop: Pressure max 250 bar
Power max 2.5 MW
Mass flow max 100 m³/h

Low pressure water loops and laboratory facilities.

Possible areas of application

Thermal design of BWR and PWR cores. Heat exchanger and high heat flux "once through" vapour generators development. Reactor safety.

Area of activity

Instability and natural convection studies with water in the pressure range 1-250 bars.

Competence acquired

Measurements of local and mean heat transfer coefficients with liquids in different geometries especially at high heat-flux conditions. Indirect and direct heating techniques and dynamic temperature and pressure measurements.

Experimental facilities

High-pressure water loop: Pressure : 225 bars
Power : 700 KW (total)
Length of test section : 8 m (one to three parallel channels)
Mass flow : $30 \text{ m}^3/\text{h}$

Possible areas of application

Hydro- and thermodynamic design for BWR and PWR primary circuits. Emergency cooling by natural convection and spray. Stability problems of steam-generators in parallel arranged tubes.

References see next page

Area of activity

Coolant ejection and unsteady-state water-vapour two-phase flow studies in the pressure range up to 60 bar.

Competence acquired

Studies of coolant ejection phenomena starting from:
- stagnant conditions and without heat addition,
- forced convection conditions and with heat addition
for determining coolant voiding time and mean coolant density variation with respect to time.
Pressure loss, instabilities, sonic velocity of two-phase flow.
Expanding behaviour, supersonic phenomena and momentum of two-phase free jets. Vapour suppression phenomena and systems.

Experimental facilities

Large scale "forced convection ejection" installation FORCE with:
- vessel pressure $p_k$ 60 bar
- vessel temperature $T_k$ 270°C
- electrical power supply to test section: $Q_h$ 96 KW (actually)
and special instrumentation for measuring steady-state and rapidly varying pressure, momentum, temperature and velocity.

Possible areas of application

Design information for reactor dynamic behaviour and reactor safety problems for BWR and PWR cores. Flash boiling studies for desalination problems. Fundamental studies on two-phase flow phenomena.

Area of activity

Liquid metal heat transfer and pressure loss in various channel geometries (single phase)

Competence acquired

Experimental facilities

NaK loop: Liquid temperature (max) : 600°C
           Power : 150 kW
           System pressure : 2 atü
           Pressure head of the pump : 1,5 at
           Mass flow : 9 m³/h

Na loop : Liquid temperature (max) : 1000°C
           Power : 500 kW
           System pressure : 5 atü
           Pressure head of the pump : 5 at
           Mass flow : 6 m³/h

Possible areas of application

Design of fast breeder core and heat exchanger for liquid metal as coolant.

References see activities III/2/f-h
Area of activity

Liquid metal boiling under forced convection with regard to safety aspects in a fast breeder reactor.

Competence acquired

Experimental facilities

**Na-loop**

- Liquid temp. (max): 1000°C
- Power: 500 KW
- System pressure: 5 at
- Pressure head of the pump: 6 at
- Mass flow: 6 m³/h

Instrumentation to measure transient phenomena at high temperature.

Possible areas of application

Fast breeder safety problems with regard to the nuclear feed-back of the void effect in case of an accident which leads to evaporation of coolant.

Area of activity

Experimental and theoretical determination of thermodynamic and transport properties.

Competence acquired

Measurements of the:
- thermal conductivity of gases, vapors and liquids,
- viscosity of liquids,
- density of vapors and liquids,
- molar heat of vapors and liquids,
- latent heat of vaporization,
- latent heat of fission,
- surface tension,
- critical data,
- vapor pressure,
- flash-, fire- and auto-ignition temperature,

Calculations of transport properties (thermal conductivity, viscosity, diffusion) using the theory of intermolecular forces and different potential models.

Experimental facilities

Apparatus for the measurements of the a.m. properties.

Possible areas of application

Heat transfer calculations of non-boiling and boiling liquids and of gases, safety problems, combustion and explosion calculations, intermolecular forces.

Possible interested industries

Chemical and Nuclear Industries.

Area of activity

Determination of accommodation coefficients by thermal conductivity measurements at very low pressures.

Competence acquired

Thermal conductivity measurements in dilute gases up to 1100°C. Experience in UHV-technique. Exact studies of radiation and thermal conductivity losses of a hot thin wire in a ultrahigh vacuum. Determination of radiation properties of solid surfaces.

Experimental facilities

Apparatus, instruments and regulating circuits for accommodation coefficient measurements.

Possible areas of application

Heat transfer between solid surfaces and gases, temperature distribution in a fuel element and heat transfer from the fuel to the cladding. Catalysis of gas reactions.

Possible interested industries

Nuclear Industry, Chemical Industry.

Area of activity

Heat-Transfer studies with gases.

Competence acquired

Measurements of heat-transfer coefficient and pressure-drop in gas heat-exchangers. Techniques for stationary and transient measurements at high temperatures, and heat-fluxes. Knowledge in the design of leak-tight gas loops. Cooling problems with water under high pressures (up to critical point).

Experimental facilities

Blower for 20 bars, 450°C for air, CO₂, N₂ (he) with variable flow-rate (2400-18000m³/h) with frequency transformer (990-3000 routes/min), power 240 KW. Different tubes, valves, venturi-tubes with ring-joint flanges (NW 500) for 20 bars, 450°C. Different blowers for atmospheric pressure (air).

Activity No.: III/2/m

Area of activity

Electronical measurements and analysis of physical phenomena related to stationary and transient heat transfer. Studies, construction and adaption of apparatus for these measurements. Visualisation of rapid phenomena.

Competence acquired

Different methods controlling temperature and pressure in the dynamic region. Construction of pressure pick-up. Visualisation of boiling and condensation simultaneous with the physical measurements. Boiling detection by means of spectral analysis using the frequency caused by the pressure pulses during condensation. Detection and localisation of burn-out phenomena in channels of different geometries. Electronical equipment for measurement of the viscosity of liquids under high pressure and high temperature. Static and dynamic measurements of two phase flow phenomena in liquid metals with high time resolution using carrier frequencies. Development of electronical apparatus for measurement and regulation. Realisation and studies for statical and dynamical measurements of local temperature.

Experimental facilities

Electronical, thermical, and optical laboratories for studies and realisation of prototypes of special instruments for the above mentioned investigation.

Possible areas of application

Reactor industries and other special measurements. Studies and realisation of test sections.

Possible interested industries

Nuclear and research industries.

Area of activity

Applications of Radiotracers in fluid flow measurements.

Competence acquired

- Fluid flow measurements and time of residence in different fluids (water, terphenyl, gasoil) with different radio-tracers.
- Leak-detection.

Experimental facilities

- Electronic apparatus to measure and to count the radiation with scintillation counters.
- Preparation of radiotracers.
- Water loop.

Possible areas of application

- Study of fluid flow, flow distribution, time of resistance of a liquid or gas in a mock-up or in industrial plants.
- Leak detection and measurement in industrial plants.

Possible interested industries

Nuclear, chemical, petrochemical industries.

Area of activity

Fast electronics techniques in the subnanosecond range

Competence acquired

- Development of advanced techniques employing fast components
- Use of these techniques in equipment design and construction for nuclear measurements (discriminators, time to height converters, single-channel analyzers, etc.) and for the detection and display of fast events (spatial sampling oscilloscope)

Experimental facilities

Laboratory equipment including fast phototube assembly

Possible areas of application

- Conventional nuclear electronics equipment transported into the subnanosecond range
- Components layout and assembling techniques for high speed networks, presently very interesting for fast computers
- Radar equipment with very high time (space) resolution, applied to traffic security problems

Area of activity

Automatic design of printed circuits and masks for integrated circuits

Competence acquired

- On-line connections with small computers (PDP-8)
- Digital control by punched tape
- Automatic nuclear experiments
- Equipment design for photo-engraving processes

Experimental facilities

- Possibility of access to CETIS computers for off-line processing with punched cards and magnetic tape equipment
- Facilities for the production of printed circuits by photo-engraving

Possible areas of application

- Printed boards for digital integrated circuits, the operation of which is identified with a synthesis of simple arithmetical and geometrical rules
- Design of masks for semiconductor devices made by ion implantation

References see next page
References

Contribution for scientific and technical journals

- "Software controlled multiple scanner for nuclear experiment", G. Colombo, N. Coppo, L. Stanchi - To be published on Nucl. Instr. and Method
Area of activity

Numerical position control, special purposes computers and recorders for acquired data

Competence acquired

Design and realisation of the following digital electronic systems:
- position control (stepping motor, shaft encoders)
- computing systems (reactor periodmeter, linearizer, digital mode control for analog computers (SIoux)
- control units for measurements equipment (timing-generator, read-out of "Instron" tensil test machine)
- control units for recorders (printers, card and tape perforators, tape readers)

Experimental facilities

- Data acquisition and processing equipment available in the center
- Electronic laboratories for research, design and maintenance; production facilities for designed equipments

Possible areas of application

Systems requiring high precision mechanical positioning, computation, automatization of measurements, input and output of data acquisition systems

Other reports

"Period Meter for adjacent time intervals" -
Internal report EURATOM Ispra 910
Area of activity

Levelmeters of high precision for liquids (radioactive, corrosive a.s.o.)

Competence acquired

Studies and design of two different measuring systems of the $D_2O$ - level in the reactor tank. The first is based on a servo-mechanism which commands a positioning head including a pressure detector. When the moving head in the reactor tank is reaching the liquid level, the pressure detector gives a signal and the head position corresponding to the level is visualized (precision 0,1 mm, indication on request).

The second system consists of a differential pressure gage measuring by means of two tubes in the reactor tank the liquid column pressure and an electronic equipment converting the pressing indication in the numerical level display (precision 1 mm, permanent indication).

Experimental facilities

$D_2O$ reactor tanks ECO and ESSOR

- height : 2.500 mm
- temperature : 20-80°C
- liquid flow : 3-400 $m^3/h$

Electronic laboratories for research, design and maintenance;
production facilities for design equipments.

Possible areas of application

Measurements and visualisation of level for all liquids, e.g. radio-active, corrosive, high viscosity.

References see next page
References

External report

"Les erreurs dans la détermination du niveau d'un liquide par différence de pression" - EUR 2958 f.d.
Area of activity

- Analog techniques - digital techniques - power electronics
- Detector systems

Competence acquired

- Design of an analog computing direct reading reactivity meter with associated peripheral equipment. Reactivity measurements of the control rods of Ispra-1 and ECO
- Development of a standard thyristor power for electrical drives with control circuits to achieve the characteristics of DC, AC and synchronous motors. Realisation of double chopper drive - crystal spectrometer drive - slow neutron chopper drive
- Non nuclear detectors: multiple D_2O detector systems (50 positions) - smoke detectors for organic loops - liquid detectors for organics

Experimental facilities

Laboratory equipment for design and production of electronic instruments for a staff of about 10 technicians

Possible areas of application

- Control and safety rod adjustment, measurement of small reactivity variations during flux kinetics experiments, reactor instrumentation
- Electrical drives with high frequency stability requirements and/or phase lock properties. Industrial applications in the paper or textile industries
- General application of smoke detectors for plants where the output of vapours and smoke must be detected
Area of activity
Magnetic forming shaping

Competence acquired
More years of experience in this field

Experimental facilities
1 apparatus "Magneform" of 6 KJ
1 apparatus "Magneform" of 12 KJ

Possible areas of application
Direct shaping of construction elements consisting of good conductive materials (aluminium, copper and their alloys)
In the case of bad conductive materials, the same technique may be applied using an intermediate of aluminium or copper.

Patents

- M. VEAUX - F. MARCHAL

Procédé pour le formage de gorges profondes sur des pièces en matériaux conducteurs, particulièrement tubes métalliques ou en matériaux céramique-métal, à l'aide d'un appareil de formage magnétique et dispositif pour la mise en œuvre de ce procédé.
Brevet belge No. 518.374 (1964)

- F. MARCHAL

Dichtung für die Befestigung einer Brennstoff-Elementhülle für Kernreaktoren aus einem Verschlusstopfen
Brevet allemand 1.937.790 (1966)
Area of activity

Working by electroerosion of all conducting materials and alloys, allowing the realisation of very complicated forms or the machining in inaccessible places, by conventional methods.

Competence acquired

Machining of very hard, refractory or sintered metals (hardened steel, stainless steel, carbide, tungsten, molybdenum)
Complex machining of conductor materials
Grate construction, microholes, dies ...
Particular experience in deep boring and long holes of very small diameters.

Available equipments

1 machine 6 kw material removed : 150 mm³/mm
1 machine 18 kw material removed : 1200 mm³/mm
1 worktable for every long holes (with dimensions ranging from Ø 4 mm to greater than 2 m)

A technique, which to our knowledge did not exist, has been put into practice after fruitless research under the European Market.

Possible area of application

- on machine : all complex forms of machining; all conducting materials
- on work-table : obtainment of high precision tubes with large wall thickness and of extreme lengths (application to test section)

Possible interested industries

High precision mechanique
All the latest technological development
Area of activity
Welding

Competence acquired
- Welding of sintered aluminium SAP
- Welding of light alloys
- Welding of refractory materials
- Welding of Zirconium alloys

Experimental facilities
- 3 welding sets applying electronic bombardment (1 gun of 1.5 Kw, 1 gun of 3 Kw and 1 gun of 10 Kw)
- 1 apparatus for flash welding
- 2 sets of argon arc welding
- 2 apparatus "magneform" allowing to perform welds by magnetic impulses (of the same type but more flexible than with welding by explosion)
- different welding sets for welding by diffusion
- brazing furnace under vacuum conditions of high capacity
- metallographic laboratory
- helium leak tightness control at room temperature and at high temperature
- 1 horizontal press of 150 tons (welding by coextrusion)
- 1 high frequency heater

Possible areas of application
All types of welding, especially welding of fuel elements and of non conventional material.

Remark:
This activity is strength related to the laboratories of classical metallurgy (studies of diffusion, mechanical tests, dilatation research, determination of the points of transformation, non-destructive testing) and in thus well adapted to the study of weldability.

Area of activity

Welding and joints
- study of special welding problems
- explosive weldings
- heterogeneous tube to tube rolled joints

Competence acquired
- Refining of the crystal grain
- Measurements to study the welding performance (fracture toughness, measure of thermal electromotive force)
- Evaluation of the welding goodness as a function of the thermal compatibility of the materials
- Adjustment of explosive welding techniques
- Development of heterogeneous rolled joints

Experimental facilities
- Semi-automatic facility for fabrication of rolled joints
- Laboratory equipment for rolled joints control (leak-tightness, strain measurements, thermal shocks, pull-out tests)
- Set-up for explosive welding
- Facility for remote welding of pressure tubes in nuclear reactors

Possible areas of application
- Control of weldings in place
- Pressure tubes and calandria tubes joints (nuclear reactors)
- Plating of different metals
- Weldings of tubes in heat exchangers
- Welding of plugs on fuel elements cannings
- Cryogeny

Possible interested Industries
- Large vessel constructors
- Vacuum industry
- Nuclear and mechanical industry

Area of activity

Welding by electron beam of metals and alloys realizing a high quality quite impossible to obtain by other fusion welding systems

Competence acquired

Welding of linear and circular shapes of refractory materials, zirconium alloys, stainless steel, for very thin thicknesses ranging from some tenths up to several millimeters. Welding with or without supports on machined pieces

Available equipment

- Generator of 10 kw - 60 kv (electron beam)
- Penetration power of greater than 20 mm into stainless steel
- Polyvalent tank of large capacity operating under vacuum (or controlled atmosphere), allowing the welding of micro­pieces, up to a diameter of 200 mm, and a length of 7000 mm.
- A device for particularly flexible movements of translation and rotation allows for several combinations

Possible area of application

Applications of development of various industrial types of weldings materials and refractory alloys, direct assembly of differential materials, geometry and precision, vacuum sealing, contamination risks ...

Possible interested industries

Sheet metal and high precision mechanical
All the latest technological developments
Area of activity

- Surface treatments by chemicals, destined to form or reform an external layer, for metal protection against other etchings operations (pickling, passivation, polishing)
- Extension of chemical etching, consisting of the removal of material from prefixed areas by chemicals

Competence acquired

- Surface treatments: - normal process for stainless steel and aluminium
  - acquired process for zirconium alloys and sintered aluminium
- Chemical treatment: - chemical boring for enlarging of aluminium tubes (canning of combustible elements)

Available equipment

- Complete equipment for surface treatment allowing the treatment of tubes up to 7 m long
- Containers complete with temperature setting devices

Possible areas of application

- Establish and coordinate all known processes
- Working out and setting up of new processes, covering all alloys and etching, according to latest technological developments
- Extensive and far reaching use of chemicals to obtain the required shapes of metals and alloys, the mechanical properties of which cause extreme difficulties for all common cutting, milling and boring operations

Possible interested industries

All industries working metal alloys, according to the latest technological developments
Area of activity

Thin evaporated films

Competence acquired

- Evaporation of metals or semiconductors in high vacuum on substrates of glass and monocrystals of CaF$_2$(111) at temperatures between 20 - 650$^\circ$C.
- Measurements of the film thickness and velocity of evaporation
- Ultra high vacuum techniques
- Examination of the structure of the films

Experimental facilities

- Vacuum evaporator with electron gun and resistance heating, with the possibility of heating also the substrate
- Apparatus for mechanical treatment of single crystal surfaces
- Film thickness monitor (quartz oscillator)
- Gas-analyser "Atlas", type Massenfilter AMP 3
- Metallographic microscope "Reichert"
- Electronic microscope "Siemens ELMI II"
- X-ray equipment
- Magnet, type B-E20-E8 "Brucker-Physik AG"

Possible areas of application

Studies in the field of catalyzators corrosion and new semiconductors, microcircuits obtained by evaporation.
Area of activity

Metallic film deposition

Competence acquired

Film deposition on metallic or ceramic supports using the following techniques:
- Electrolytic deposition in aqueous solutions or in molten salts
- Chemical deposition in aqueous or in molten salts
- Immersion deposition in molten salts
- Vacuum evaporation by Joule effect heating or electron beam
- Refractory metals deposition (W, Mo, Ta, Nb) by chemical reduction of the volatile salts in vapour phase
- Specially oriented films deposition

Experimental facilities

- Equipment for vacuum deposition
- Equipment for electrolytic deposition
- Thermostat and cryostat
- Melting furnaces for salts and metals
- Equipment to deposite refractory metals by chemical reduction
- Control tests equipment for the deposited films

Areas of application

The metallic deposits may have many applications. Examples are
- corrosion protective layers
- wear and diffusion layers
- films improve the brazing between metallic or ceramic-metallic components
- the oriented films can find useful application in the direct conversion

Patents

11 patents
Area of activity

High temperature techniques
- Testing of materials at very high temperatures (above 1000°C)
- Ceramic-metal soldering; fabrication of metal-ceramic sandwich
- Surface blackening
- Chemical vapor deposition

Competence acquired
- Soldering of Al₂O₃ to Nb 1% Zr and fused quartz to Kovar
- Improvement and development of new methods for surface blackening
- Deposition of Nb on Al₂O₃ for working temperatures in the 1000 + 1500°C range

Experimental facilities
- Plasma generator - power 100 KW
  temp. 1000 + 15000°C
- Furnace of high temperatures (1000 + 4000°C)
- High vacuum furnace for soldering by high frequency induction heating or by infra red radiation heating
- Thermal cycling facility and test facilities for endurance tests at very high temperatures
- Chemical vapor deposition - plating equipment
  - Plasma flame spray system METCO type 2M

Possible areas of application
- Direct energy conversion
- Refractory materials
- Test sections with quartz tubes; quartz window
- Insulator in corrosion environment
- High temperature insulations
- Thermionic converters; diffusion barriers; nuclear fuel cladding
- Thermal control surfaces for space power plants

Possible interested industries
Nuclear, Chemical, Space, Aeronautical Industries, Industry of refractory materials;

Area of application
Preparation and testing of high temperature materials

Competence acquired
Preparation and testing of UC

Experimental facilities
- High temperature resistance furnaces up to 2500°C
- Electron-beam furnace
- Hot press
- Induction furnaces
- Arc melting furnace
- Glove-box lines
- Metallurgical testing equipment

Areas of application
Development of nuclear and non nuclear ceramic materials

Possible interested industries
- Reactor industry
- Space industry
Area of activity

Sealing and Leak-detection
- Static and reciprocating seals (metallic, asbestos organic sealings)
- Rotating mechanical seals
- Leak measurements and detection in all kind of seals and joints, in pressure or vacuum systems
- Leak detection by radioactive tracers.

Competence acquired
- Seals testing criteria and leak measurements
- Development of new metallic seals
- Development of a leak detector for organic vapors
- Behaviour of mechanical seals at elevated temperature
- Study of wear of mechanical seals
- Study of pressure distribution in a lubricant layer for rotating seals
- Preparing of radioactive tracers

Experimental facilities
- Test device for static and reciprocating seals
- Test set-up for load cycling with hydraulic clamping system and leak-detection facility
- Installation for testing metallic sealings
- Vacuum plant with He mass spectrometer
- Test device for mechanical seals at elevated temperature
- Test device to study wear in different materials
- Electronic chains to measure radiation by scintillation counters

Possible areas of application
- Vacuum and pressure seals
- Seal between nose unit of refuelling machine and pressure tube in nuclear reactor
- Sealing of valves, pumps and compressors
- Leak detection in industrial plants

Possible interested industries
- Vacuum industries; Constructors of valves and joints
- Nuclear and Chemical Industries
- Petrolchemical Industries

Area of activity

Testing of components and prototypes
- Testing of components of organic liquid loops
- Testing of entire channel sections
- Testing of fuel bundles fixation systems in nuclear reactors
- Testing of components of a refuelling machine
- Testing of components for P.W.R.

Competence acquired

- Testing of channels and fuel elements in normal operating conditions of ORGEL reactor (organic liquid - 400°C - 20 Atm)
- Techniques for performing measurements at elevated temperatures in organic liquid
- Operating tests of fuel elements loading and unloading for nuclear reactors with vertical channels

Experimental facilities

- Organic liquid loop allowing for thermal shocks on entire channel sections (400°C, 40 Atm, 90 m³/h)
- Organic liquid loop allowing endurance and reliability tests (400°C, 60 Atm, 15 m³/h)
- Facility for operating tests of fuel elements loading and unloading

Possible areas of application

- Testing of channels and fuel elements for heavy water moderated nuclear reactors
- Testing of loading and unloading operations for heavy water moderated nuclear reactors
- Testing of valves, flow meters, pumps, seals, etc.

Possible interested industries

- Nuclear, petrochemical industries
- Industries interested in P.W.R.
Area of activity

Behaviour of reactor components under irradiation conditions. (For instance: creep under irradiation of pressure tubes, joints and welds behaviour under irradiation etc ...)

Competence acquired

- Irradiation of different types of graphite and carbons for the core structures of a nuclear reactor
- Preparation of pressure tubes to be irradiated in the ESSOR reactor
- Development of the correspondent hot cell apparatus

Experimental facilities

- Availability of ESSOR Reactor (Ispra)
- Availability of H.F.R. Reactor (Petten)
- Availability of Hot Cells in Ispra and Petten
- Workshops and laboratories for fabrication and instrumentation of the irradiation rigs

Possible areas of applications

Nuclear reactor development

Possible interested industries

Nuclear industries

Other reports

Several internal reports and notes on the ESSOR pressure tubes construction and irradiation programme.
Area of activity

Hydrodynamics and vibrations.
- Hydrodynamic measurements
- Theoretical and experimental study of vibrations of mechanical components.

Competence acquired
- Determination of friction coefficients, pressure drop in complex structures, and of fine velocity distribution
- Measurement of very small velocities and of turbulence
- Flow induced vibrations in complex structures.

Experimental facilities
- Water loop (monophase and biphasic water flow with gas injection)
- Instrumentation to measure pressure, velocity, and turbulence
- Electronic measuring device to measure vibration parameters
- Analyser of frequencies and of amplitudes (frequency spectrum)
- Organic liquid loop for tests under thermal flux conditions.

Possible areas of application
- Hydrodynamic behaviour of nuclear reactor components
- Analysis of complex structures vibrations

Possible interested industries
Industries working in the Nuclear, Chemical, Naval, Space, and Automobile fields.

Safety
- Rupture of a channel in reactors with pressure tubes
- Consequences of the rupture of components in a pressurized loop

Competence acquired
- Experimental study on full scale models of thermal and mechanical phenomena, caused by the burst of a pressurized structure

Experimental facilities
- Experimental loop, volume $5 \text{ m}^3$ for tests at high pressure (50 atm) and at high temperature ($450^\circ\text{C}$), connected to a reservoir (12 atm, 12 m$^3$)
- Pressurization systems for liquids or for gas up to 2000 atm

Possible Areas of application
- Propagation of bursts in a beam of tubes (heat exchangers, reactors with pressure tubes)

Possible interested Industries
- Nuclear, Chemical industries

References see next page
References

- "Full scale experiments on the consequences of a pressure tube rupture in ESSOR reactor vessel", H. Holtbecker, M. Montagnani, G. Verzeletti, EUR 4101.f.e. (1968)
Activity No.: III/5/f

Area of activity
- Reliability analysis of mechanical structures and of various systems

Competence acquired
- Knowledge of statistical methods for reliability analysis
- Analysis of brittle materials

Experimental data
- Data from tests on weldings and of rupture tests
- Results from tests performed on components mounted in experimented loops

Possible areas of application
- Analysis of conventional nuclear structures
- Reliability study of welded structures

Possible interested industries
- Industries fabricating complex structures (reactors, ships
- Constructors of electric power stations

References see next page

IV) Materials

IV/1 Material Testing
IV/2 Material Development
Area of activity
Testing of Materials and structures
- thermal and mechanical fatigue
- creep and creep damage
- tensile and charpy tests
- metrology and non destructive testing
- wear
- study of the dynamic behaviour of materials (prestressed concrete)
- effects of combined mechanical and thermal stresses

Competence acquired
- Determination of parameters influencing the thermal fatigue behaviour of materials
- Study of mechanical fatigue of bellows
- Creep rupture and creep damage for S.A.P.; analysis of experimental data with statistical methods
- Ultrasonic controle of pressure tubes and of Zy-SS joints
- Methods to test wear and fretting corrosion at elevated temperatures
- Behaviour of materials under dynamic solicitations produced by explosives or by magneforming
- Computer codes to calculate dynamic behaviour of structures
- Buckling under thermal cycling of fuel elements

Experimental facilities
- Mock-up allowing for fast thermal cycling; maximum temperature: 1000°C, max. cycling velocity 30 cycles/min
- Facility permitting mechanical fatigue tests on very big structures (reactor vessels)
- Apparatus to perform fatigue tests on metallic bellows at elevated temperatures.
- Creep furnaces and measurement devices
- 3 tensile machines (50 tons, 20 tons, 2 tons)
- 2 Charpy machines (30 kgm - 5 kgm)
- Ultrasonic device to detect defects and to measure the thickness of pressure tubes
- X rays apparatus, röntgen apparatus
- facilities to perform fretting corrosion in water (250°C), friction tests combined with vibrations (350°C, 25 Hz), measurements of friction coefficients
- Instrumentation for measurements of fast phenomena (10^4 to 10^6 Hz) pressure transducers, shock-tubes, fast film camera (up to 1, 2 10^5 fot0's/sec.), Hopkinson bars,
- Device to produce dynamic solicitations by hydraulic means

Possible areas of application
- thermal fatigue (fuel element cannings, heat exchangers)
- quality and dimensional control
- contacts between different materials in nuclear reactors
- safety studies on structures
- study of fast phenomena (water-hammer, collapse of vapor bubbles, explosive evaporation)

Possible interested industries
- Nuclear, chemical, mechanical industries

Area of activity

- Mechanical properties of structural materials
- Technological tests on assemblies and parts of fuel elements

Competence acquired

- Tensile testing between -196 still 1000°C (in air or under vacuum)
- Micro-hardness measurements till 1000°C in vacuum
- Technological tests on tube material at 450°C (burst test, fatigue, creep)
- Development of computer program CATT (computer analysis of tensile tests)
- Creep and fatigue tests on specimens of bars or tubes and assemblies or subassemblies of fuel elements

Experimental facilities

- 2 Instron tensile testers (1 g to 5 tons)
- Automatic processing of tensile data (digital voltmeter, puncher, timer)
- 1 SEAVOX prototype micro-hardness tester (1 g to 1000 gr) in vacuum till 1000°C
- Other apparatus: Leitz Durimet micro-hardness, 2 Wolpert macro-hardness, 2 Wolpert impact testers, basic metallographic equipment, 3 burst units
- Creep machines: 36 Adamel creep machine (900°C)
- Fatigue machines:
  - 2 creep machines for tests on fuel elements (test chamber - diameter 100 mm, height 1 m)
  - 18 rotative bending machines (room temperature)
  - 2 Universal fatigue machines (vibrating tables) from 200 kg to 2 tons at 600°C

Areas of application

Mechanical properties of all types of materials in the range of -196°C to 1000°C.

Possible interested industries

All industries working for: nuclear research, space research, special metallurgy, etc.

latents

"Machine de microdureté à chaud sous vide", P. Bonnet, H. Grin, (1955)
Activity No.: IV/1/c

Area of activity
Non-destructive testing and dimensional control of nuclear fuel element components.

Competence acquired
Development and use of the non-destructive testing techniques for:
- visual inspection, liquid penetrants, endoscopy
- sheath contour measurements and surface-state control
- special dimensional control, i.e., inside diameter measurement without contact, wall thickness measurement by beta-absorption
- radiography
- ultrasonics, resonance and pulse-echo techniques, attenuation measurements;
- Eddy-currents
- Tightness control; Helium leak test

Experimental facilities
- Dimensional control laboratory:
  - automatic vertical bench for deflection and outer diameter measurements;
  - automatic vertical bench for inner diameter measurements;
  - horizontal measuring benches;
  - contour measuring projector;
  - beta-gage wall thickness measurements bench;
- Radio-raphy laboratory:
  - 150 kV and 50 kV generators
  - semi-automatic radiography bench
- Ultrasonics laboratory:
  - SPERRY, AEG, and MANSON apparatus
  - semi-automatic bench
- Eddy-currents laboratory:
  - BUDD-FORSSTR and CNS apparatus
  - vertical exploration bench
- Tightness control laboratory:
  - 3 immersion chambers, P = 30 kPa/cm² - diameter: 120 mm length 3 m
  - detection chambers
  - 2 helium leak detectors

Areas of application
- Nuclear fuel element components, particularly:
  - rods in the course of fabrication, sheathing, plugs, welding, thermocouples,
  - experience easily transferable to non-nuclear fields

Possible interested industries
- Light metals
- Nuclear Engineering
- Precision Engineering

Area of activity

In and out-of-pile measurements of thermal and mechanical behaviours of solid materials

Competence acquired

Heat transfer coefficient measurements between room temperature up to 2000°C of structural and solid nuclear fuel materials. In-pile creep measurements up to 400°C.

Design of irradiation devices - Nuclear calculations - After-irradiation works - Hot laboratories equipment - Capsules construction and testing techniques

Experimental facilities

- Apparatus for heat transfer measurements between 100°C and 2000°C (steady state, calorimetric, comparative and unsteady methods. electron beam)
- Other facilities to assemble for other required measurements
- In-pile rigs for creep measurements up to 400°C
- 2 in-pile rigs in Ispra-1 reactor for irradiations at 20-30°C

Possible areas of application

Engineering applications for general purposes, Nuclear design and new materials evaluation

Possibly interested industries

Nuclear, mechanical and engineering industries

Area of activity

Experimental Stress analysis through Photoelasticity, Strain-gages (up to 600°C) and Moiré

Competence acquired

Stress analysis of various parts of fuel elements: grids, finned tubes, weldings, stresses around inclusions, strain-gages bonded with Rokide process

Experimental facilities

- Chapman photoelastic bench
- Stress-freezing furnace
- High-speed milling machine for fabrication of models
- Various Strain Indicators
- X-Y Strain Recorders
- Flame spray gun for Rokide Process
- Furnaces for calibration of strain-gages

Areas of application

- Determination of the stress field in mechanical parts (through photoelastic models)
- Verification of the state stress in several points of mechanical part up to 600°C (true part under real loading conditions)

Possibly interested industries

- Motor industry
- Space industry
- Machine Tools

Area of application
- Zirconium Corrosion in water, steam or organic environments at high temperature, in-pile and out-pile,
- Studies on ZrO₂ layers, catalysis on surface

Competence acquired
- Corrosion measurements on different Zr-alloys on the above environments. Topical alloy design
- Thin film techniques; measurements of electrical parameter and specific apparatus development; measurements on catalysts

Experimental facilities
- No. 8 thermosyphon loops for high temperature terphenyl (420°C max; p ≤ 20 kg/cm²) - 1 in-pile loop (KID),
- No. 10 autoclaves for water, steam or gas corrosion measurements at high temperature and pressure: P ≤ 150 kg/cm², T ≤ 750°C (at lower temperature the pressure may be higher)
- High vacuum metallizing facilities and specialized apparatus for electrical measurements
- Hot laboratory facilities

Possible areas of application
- Development of Zr-alloys for higher temperature use in steam (400°C) or gases, or organic
- General corrosion testing and material reception
- Corrosion measurements in general
- Studies on corrosion mechanisms
- Studies of surfaces

Area of activity
Compatibility and Corrosion

Competence acquired
- Compatibility and diffusion studies between different materials (solid-solid, solid-fluid metal and solid-gas systems)
- Corrosion tests in organic liquids, water and water-vapour,
- Huey and Strauss tests,
- Salt spray tests and artificial industrial atmosphere tests stress-corrosion tests,
- Electrochemical kinetics, intensiostatic and potentiostatic polarizations,
- Measurements of equilibrium e.m.f.
- Studies of transport phenomena in ionic solids,
- Thermodynamics of many components systems

Experimental facilities
- Furnaces for heat treatments under vacuum and controlled atmospheres,
- Apparatus for purification and filling of liquid metals with low melting points,
- Autoclaves,
- Salt spray and industrial atmosphere boxes
- High and low temperature stress-corrosion device,
- Thermobalance,
- Apparatus for e.m.f. determination on cells with very high impedance
- Polarization unit
- Potentiostat

Area of application
- Qualitative and quantitative evaluation of corrosion and compatibility problems between different materials
- Study of the possibilities of preventing and neutralizing them

Possibly interested industries
Metallurgical and electrochemical industries

Area of activity

Elaboration on laboratory scale of metallic and metalloceramic materials

Competence acquired

Elaboration of dispersed phase alloys by:
- Sintering of metallic powders
- Chemical Reaction between solid powdered phase and vapour phase
- Ultra high cooling from the liquid phase

Elaboration of composite fiber reinforced materials by:
- Unidirectional solidification
- Dispersion of ceramic fibers in a liquid metallic matrix

Experimental facilities
- ARC-furnace
- Induction-furnaces
- Electron-bombardment furnaces
- Sintering press
- Extrusion-press
- Plasma-jet swaging facility
- Several resistance furnaces for heat treatment,
- Splat cooling apparatus,
- Rolling mill

Possible areas of application

Elaboration of experimental alloys, especially dispersed phase alloys and fiber reinforced alloys

Possibly interested industries
Metallurgical and mechanical industries

Area of activity

Structural and physical metallurgy

Competence acquired

- Application of the electron-microanalyzer in the field of metallography and solid state diffusion applications of X-ray microradiography
- Ion-analyzer (same as above)
- Structural analysis (phase identification, preferred orientation, parameter measurements etc.) with the aid of an X-ray diffractometer,
- Dilatometry
- Optical micrography (aluminium-alloys, zirconium-alloys, carbides, pyrolytic graphite etc.)
- Electron microscopy (dispersed phase alloys)

Experimental facilities

- Electron microprobe CAMECA
- Ion analyser CAMECA
- X-ray diffractograph SEIFERT-PHILIPS
- Electron-microscope PHILIPS EM 100,
- Optical microscope REICHERT, LEITZ, ZEISS and metallographic preparation chain
- Ion-microscope TUB’ TUBNER
- ADAM dilatometer (up to 1500°C under high vacuum 10^{-5})
- Laboratory furnaces for thermal treatment under high vacuum up to 1200°C

Possible areas of application

- Study of metal alloys
- Microstructure
- Study of phase transformations
- Study of dispersed phase alloys

Possibly interested industries

Non-ferrous metallurgical industries in general

Area of activity

Dispersion hardened materials and particularly aluminium hardened with dispersed alumina

Competence acquired

- Production of dispersions of very fine sized alumina in aluminium,
- Measurements of mechanical properties: Stress strain, creep,
- Observation of plastic phenomena on sample surfaces,
- Electron microscope observation of dislocations,
- Influence of plastic deformation on internal friction

Experimental facilities

- Instron, tensile testing machine,
- 2 machines for creep,
- 3 equipments to measure internal friction (frequency of 1 cycle to 50 kilocycles),
- 2 electron microscopes

Possible areas of application

- Heavy water reactors
- Aeronautic industry
- High temperature materials

Area of activity

Impervious impregnated graphite

Competence acquired
- Impregnation of graphite by Mg and its alloys, by Al-Si (13% Si), by Bi and other materials.
- Measurements of mechanical and thermal properties
- Preparation of test fuel elements for irradiation experiments and for special mock-up

Experimental facilities

V) CHEMISTRY

V/1 ORGANIC CHEMISTRY
V/2 NUCLEAR AND RADIATION CHEMISTRY
V/3 HIGH TEMPERATURE CHEMISTRY
V/4 CHEMICAL ENGINEERING
Area of activity

Organic synthesis
Organic labeled compound synthesis
Structure determination and theoretical model evaluation

Competence acquired

- Synthesis of several quinqua, hexa and higher polyphenyls compound
- Synthesis of substituted aromatic compounds
- Synthesis of deuterated (partial and total) compound
- Synthesis of $C_{14}$ labeled hydrocarbons
- Electronic configuration studies of these molecules

Experimental facilities

Laboratory equipped for organic synthesis and purification
Existing programs for theoretical evaluation

Possible areas of application

- Synthesis of pure reference compound for industry and biology
- Structure determination

Possible interested industries

Chemical industry and biology

Area of activity

Inorganic and organic analytical chemistry, radiochemical methods of analysis (production of radioisotopes).

Competence acquired

Qualitative and quantitative analysis of various materials (organic coolants, Uranium and its compounds, metals alloys, gases, pesticides, biological materials etc.)

Trace analysis - Isotopic analysis - Structural studies and analysis of organic molecules - Organic microanalysis - Synthesis of reference products or standard - Researches and developments of a new analytical procedure and instrumentation - Techniques of automation and computer applications - Techniques of fast and thermal neutron activation - Radioactivity measurements techniques - Chemical and radiochemical separations - Radioisotopes production - Basis studies on ionization potentials, bonding energy, radiolysis, reaction kinetic, excitation processes in flames.

Experimental facilities

Possible areas of application

Analytical programs in any industrial and research activity

Area of activity
Electron and X-rays irradiation
Use of labeled compounds

Competence acquired
Irradiation of organic and inorganic molecules with a 2 MeV accelerator. Dosimetry well known
Irradiation with a X-ray machine
Irradiation and analysis of C\textsubscript{14} labeled compounds

Experimental facilities
2 MeV electron accelerator (horizontal)
Power 0.5 k\text{W} with a 90° beam deflector and scanning possibility
Vessels and loops for high temperature experiments
(Packard counting equipment for C\textsubscript{14} compounds

Possible areas of application
All kinds of irradiation with X-rays and electrons

Possible interested industries
Chemical and petrochemical industries

- Appareils de mesures classiques
- Possibilité de travailler avec radiotracer

Possible areas of application
- Procédés de métallurgie extractive
- Étude des piles ou accumulateurs à haute température
  (voir. Recherche en phase d'exploration)
Area of activity

High temperature pyrolysis of organic compounds
Degradation studies

Competence acquired

- Elaborated degradation studies of organic coolants
- Determination of the kinetic laws and calculation of the Arrhenius thermodynamic constants

Experimental facilities

An important set of ovens for operations up to 700°C

Possible areas of application

Testing of organic and inorganic compounds

Possible interested industries

Chemical industries interested in decomposition studies of high temperature resistant compounds

- The thermal decomposition of o-, m-, and p-Terphenyls in the Presence of clay minerals (in Coll. with H. Rau)

- Paper presented before the division of petroleum chemistry, American Chemical Society, Miami Beach Meeting, April 9–14, 1967
Area of activity

Control, study and treatment of active and non-active effluents

Competence acquired

- Decontamination and purification of polluted water
- Combustion of high molecular weight compounds
- Flocculation—basic and applied studies

Experimental facilities

\( \alpha, \beta, \gamma \) detectors
thin layer distillation column 20 kg/h
pilot flocculation—sedimentation installation 5 m\(^3\)/h
2 potential-meter
submerged combustion installation 50 kg/h

Possible area of application

Water purification method "cascade" (pollution)
Deposition aspect in desalination

Possible interested industries

All industries concerned with water pollution

Area of activity

Purification by distillation, liquid extraction and catalytic experiments

Competence acquired

- Distillation of organic coolants on pilot scale
- Purification by liquid extraction of high molecular weight compounds for organic coolants
- Catalytic elimination of chlorine and oxygenated compounds in organic coolants

Experimental facilities

- Distillation columns; liquid-liquid extraction laboratory plant 450°C, 10 mm Hg
- Loop and auto-claves and columns for catalytic experiments 450°C, 25 atm.
- Advanced equipment for basic catalyst studies (BE.T, DTA thermobalance, microscope, ultracentrifugation 50.000 rpm).

Possible areas of application

Catalytic studies - Particle size determination
Adsorption and desorption studies

Possible interested industries

Oil refining plant - catalytic processes

VI) INFORMATICS

VI/1 BASIC SOFTWARE
VI/2 APPLICATION SOFTWARE
VI/3 TRANSMITTING SYSTEMS
Area of activity

Systems of coordinated subroutines to facilitate efficient use of peripherical devices or solution of special problems.

Competence acquired

CALCOLP routines - Set of Fortran oriented routines allowing a very easy preparation of a tape which will be used by a CALCOLP DATA PLOTTER. Although individual subroutines may be used for special purpose design, the realisation of a graphic with scaling data, axis graduation and labelling, plotting of several curves may be run with a simple call of a subroutine. Written for IBM 7090; then translated and adapted to IBM 360.

FIOT FORTRAN compatible input output package working in trap mode allowing complete overlapping of CPU and channel time.

(2 versions corresponding respectively to version 2 and 3 of Fortran II on IBM 7090)

LISTPROCESSING System of FORTRAN oriented subroutines allowing creation and manipulation of very complex lists of variable length data. Developed for IBM 360 and used in Hybrid Apache.

SALYB Program running on IBM 7090 or IBM 360 under control of respective systems. Allows direct solution of systems of first order differential equations. The evaluation of the derivatives is expressed in a Fortran subroutine. Facility for use of tabulated functions, delay functions and automatic printing or plotting of results are provided.

Computing facilities

IBM 7090, IBM 360/65

Possible areas of application

General support to problem programming

Possible interested industries or organizations

All computing centers and European computer manufacturers

Area of activity
Simulation of computers on complex systems

Competence acquired
- Simulation of IBM 1401 on IBM 7090
- Simulation IBM Disks units 1301 of IBM 7090 computer on IBM 2311 diskpacs units of 360/65 computer. Complement to IBM Emulator
- Simulation on IBM 360/65 of CAME 510 with console typewriter, paper tape reader and punch units, printer and card reader, drum with decentralisation unit. Simulation of special cardencers analog input, digital input and output, control console and teleprinters is implemented to take care of special needs of T.I.S. control system of reactor ESSOR. Simulation is developed with special regard to program debugging aid.

Computing facilities
IBM 7090, IBM 360/65

Possible areas of application
- Test and evaluation of new computer logic or other equipment at design level, system testing or evaluation, debugging
- Elimination of obsolesed computers without need of reprogramming

Possible interested industries or organizations
All computing centers, european computers manufacturers

Area of activity

Definition of problem-oriented languages and development of corresponding compilers

Competence acquired

Special language for expression of problems depending on resolution of sets of differential equations. The solution may be obtained by means of digital or analog computers. In this last case the compiler gives panel connections and static check values (written for IBM 7090) (APACHE).

Development of previous language to take account of new possibilities as conditional assembly, use of external subroutines, logical variables etc., oriented versus more modern hybrid analog computers (Being developed on IBM 360) (Hybrid Apache).

Little "Fortran-like" language, giving immediate diagnostic and allowing immediate execution on statement basis; designed for remote console conversational use with IBM 360 (LICE).

A COBOL-like programming language which permits to compile programs on IBM 7090 which can be run on IBM 1401. Part of the system is a 1401 simulator on IBM 7090 which permits to run the problem directly.

A special purpose programming language for automatic processing of texts in natural language (SLC = Simulated Linguistic Computer). An operational version exists for IBM 7090. A new improved version is being developed for IBM 360 under O.S.

Computing facilities

IBM 360/65, IBM 7090

Possible areas of application

All fields (numerical or non numerical) of application where special problem-oriented programming language is advantageous.

Possible interested industries or organizations

All computing centers and European computer manufacturers

Methods in Automatic Documentation

Competence acquired

- A project was started with the principal objective of automatic indexing within the framework of the EURATOM Nuclear Documentation System. Many tests had been performed which pointed out that with the approaches adopted automatic indexing can reach the level of routine work in manual indexing. An experimental system is being prepared with facilities for improvements. Experiences had been gained in text manipulations and association methods.

- The problem of association factors has been studied and some new approaches introduced for further research.

Computing facilities

IBM 360/65 and IBM 7090,
Text collections in machine readable form,
glossaries

Possible areas of application

- All kind of information retrieval systems (e.g. Documentation, Management Information)

- Information Retrieval, Automatic Indexing, Machine Translation

Possibly interested industries or organizations

Documentation Centers

Contributions to scientific and technical journals

Activity No.: VI/2/b

Area of activity

Machine Translation (MT), Machine-aided Translation (MAT)

Competence acquired

- **Machine-aided translation**: Automatic compilation of multilanguage terminology glossaries (EUROTERRI) in cooperation with the terminology office of the EEC. Automatic dictionary search facility for translators (DICTAUTOM) developed by the University of Brussels under contract of EURATOM.

Computing facilities

Special-purpose programming language SLC for natural language text processing operational with IBM 7090; in course of implementation in a modified and improved version (SLC-II) for IBM 360 under OS control. Machine dictionaries (Russian-English, 150,000 entries for science and technology). Concordances, Russian text collections on magnetic tape. Keypunch service for Russian texts with IBM 026/029 and Russian keyboard Flexowriter.

Possible areas of application

Scientific and technical information
Documentation

Possibly interested industries or organizations

Research offices and translation and documentation services

Area of activity

All kinds of administrative data processing (A.D.P.) comprising integrated systems and data collection.

Competence acquired

Many kinds of A.D.P. problems, comprising library and documentation problems, statistical and management problems, have been solved for the European Communities. The advanced type of data handling as intended by the term "integrated systems" has been undertaken:

- an integrated library system destined to handle all aspects of library management: acquisition, cataloguing, loan and bibliographical information. Various functions in this system are treated in real time (see ref.1)
- an integrated system performing maintenance planning, accounting of various disposable resources, financial accounting and the collection of reliability data for the ESSOR reactor (see ref.2)
- an integrated system covering planning, control of progress in production, cost, stock and personnel accounting for the mechanical fabrication department.

An analysis is going on for the construction of a management information system covering the Communitarian research.

Computing facilities

IBM 7090, IBM 1401, IBM 360/65 (512K), IBM 360/30 (16K)
IBM display 2260, IBM 357 data collection system.

Possible areas of application

Various realised procedures are of a general interest and might be used by others with only minor modifications. The vast experience acquired in different fields guarantees adequate solutions for all kinds of A.D.P. and management applications which might be required. Also an experience in teleprocessing use is available.

Possibly interested industries or organizations

In principle all governmental institutions, enterprises and libraries might be interested.

Area of activity

Independent or dependent supervisor systems for problem programs scheduling and libraries systems gestion with special control languages

Competence acquired

1401 system: independent system allowing quick look-up and loading of problem programs written on a library tape
GLEE system for IBM 7090. Allowing loading from disks programs and related data libraries, used in conjunction with Fortran II monitor and/or IBSYS system
HULPSS: independent system for IBM 360/30; allows use of tape program library or card read programs to be run in a multiprogramming environment
CARONTE System: through its control language allows the automatic execution of sequences of programs (both scientific and commercial oriented) in which automatic transfer of data is required. The system runs under 0.S. of IBM 360. Programs and data are stored in auxiliary memories.
Teleprocessing system: extension and adaptation of H.A.S.P. system to allow use of automatic remote stations for data acquisition control of process etc. and/or conversational stations

Computing facilities

IBM 790, IB: 360/65

Possible areas of application

All areas where more scientific specific control or facilities on computers than those delivered by the manufacturers, are required.

Possibly interested industries or organizations

All computing centers and european computer manufacturers

Area of activity

Transmitting systems

- Telecommunication and teleprocessing
- Digital high speed data transmitting systems using cables

Competence acquired

- A frequency-multiplex-system for twenty channels providing a total data flux of \(2 \times 10^6\) Bauds has been developed (DATInC).
- A bipolar-DC-pulse transmission system performing a data flux of \(2 \times 10^6\) Bauds has been investigated, two prototype-stations (transmitters, receivers) have been realized. Half or full duplex mode can be achieved. Transmission distances are up to 3 km using a coaxial cable with 8 mm outer diameter. Special advantage of the system: damping-free ramifications allow connection of various remote stations and computers to one cable (ORLOC).
- A data link using the transmission modes of point 2) is operating for on-line connection of analyzers with the central computer 360/65 in the research center of Ispra.

Experimental facilities

Central computer IBM 360, terminals peripheral units IBM 1070, digital data sources (analyzers, digital voltmeters, etc.). Electronic laboratories for research, design and maintenance.
Production facilities for developed equipments.

Possible areas of application

Tele-processing, data transmission between f.i. central computer and remote stations.
