## SUMMARY AND CONCLUSIONS

The EC is Latin America's second most important trade partner after the USA. On the other hand, Latin America's relative importance to the EC is rather modest accounting in 1987 for 5.6% of its total imports (17% of EC imports from Class 2) and 4% of total EC exports (13% of EC exports to Class 2).

The EC had a negative trade balance with Latin America throughout the 1979-1987 period.

EC imports from Latin America expanded rapidly from 1979 to 1985 (only EC imports from the Mediterranean among LDC regions increased more) and decreased sharply in 1986 and more moderately in 1987. What mostly accounted for these sharp trends were the changes in the value of EC imports of fuels and to a lesser degree food items from Latin America.

EC exports to Latin America increased slightly from 1979 to 1987 with cycles that peaked in 1981 and 1985 and slumped in 1983. This is the worse EC export performance among developing regions, if one disregards the rather sudden fall of EC exports to the ACPs in 1986 and 1987. Chiefly responsible for these trends were EC exports of manufactures to Latin America.

Almost half the EC imports from Latin America are food items and most importantly coffee and oil seed cake. Fuels, ores and metals and manufactures cover most of the rest. The bulk of EC exports to Latin America are manufactures with the rest made up from metals and food items.

The single most important EC trade partner in Latin America is Brazil. Following in importance are the other two Latin American NICs (Mexico and Argentina) and the oil exporter Venezuela. Other important trade partners are Chile and Colombia. Since all these Latin American countries are members of ALADI, it is evident that the bulk of the EC trade in Latin America is conducted with this region.

Analysis in Value in ECU

## **PART ONE: TRADE BETWEEN THE EC AND LATIN AMERICA IN THE 1979-1987 PERIOD**

### **A. AN OVERVIEW OF EC-LATIN AMERICA TRADE (1979-1987)**

#### **A1. THE INTERNATIONAL CONTEXT OF EC-LATIN AMERICA TRADE**

Latin America is a group of twenty LDCs whose share in total trade in 1986 was in the region of 3.5%<sup>1</sup>. Latin America's 1986 share of international trade however was less than its 1980 level. Its share of world imports peaked in 1981 and decreased subsequently below its 1980 level of about 5%. Its share of world exports peaked in 1981 and 1983 at over 5%.

The EC on the other hand, is a major economic grouping of highly industrialised countries. Thus, it is not surprising that it represents a large share of international trade. If one includes the intra-EC trade (which is about the size of EC's external trade) then in 1986 the EC accounted for 37% of world exports and 35% of world imports. EC export activity for the 1981-1985 period was below its 1980 level only to surpass it in 1986. EC imports were similarly depressed during the 1981-1985 period, only to partly pick up in 1986.

EC-Latin America bilateral trade represents only a very small part of international trade, in the region of 1%. In fact, when calculated in terms of US dollars, this share has registered an increase from 1979 when it was in the region of 0.8% of the world trade.

Latin American exports to the Community benefit from the provisions of the Generalised System of Preferences (GSP) and a number of bilateral and regional non-preferential trade agreements<sup>2</sup>. Thus, EC tariff preferences to Latin America discriminate only vis-a-vis Class 1 and Class 3 exports to the Community. On the other hand, ACP and Mediterranean LDCs enjoy an overall more favourable export status in the Community market than Latin American and Asian LDCs.

#### **A.2. GENERAL TRENDS OF EC-LATIN AMERICA TRADE (1979-1987)**

##### **A.2.1. TRENDS OF EC IMPORTS FROM LA20 (1979-1987)**

In 1987 EC imports from Latin America were 44% more than they were in 1979 (Table 1.1) a trend that is translated into a 4.7% ARG (A.1.1). This performance was better than that of the Class 2 average. In fact, it was only bettered by the Mediterranean LDCs (7.4% ARG) among developing regions of the world.

Despite this increase however, EC imports from Latin America in 1987 were at a sharply downwards trend. Indeed, while they peaked in 1985 at more than double their 1979 level (226%) they declined in the following two years. The 1979-1985 increase of EC imports from Latin America was sharper

<sup>1</sup> Shares used in section A1 come from UNCTAD (1988) *Handbook of International Trade and Development Statistics* 1987 supplement, NY. UNCTAD data were used here instead of COMTRADE because of their more accurate definition of the volume of world trade.

<sup>2</sup> See: Commission des CE (1988) *Accords et autres engagements bilatéraux qui lient les Communautés à des pays tiers* Bruxelles, January.

than the increase of EC imports from any other developing region except for the Mediterranean LDCs. At the same time however, although EC's imports from all LDCs were reduced in 1986 and 1987, except for imports from Asian LDCs that in 1987 increased, imports from Latin America were reduced at a faster rate (Table 1.2).

Comparing the overall performance of EC imports from various developing regions in the 1979-1987 period indicates that the pattern of tariff preferences it grants does not necessarily guarantee success in the export performance of the preferred recipients. Indeed, if tariff preferences were the only determinant of the recipient country's export performance in the market of the donor country, then one would expect recipient countries to have a more successful performance in this market. It transpires however that while the ACP exports enjoy the most advantageous status in the EC market, they have overall exhibit a much poorer record in the EC market compared to the Asian and Latin American LDCs that only benefit from the provisions of the EC GSP.

**Both USA and Japan imports from Latin America performed better than EC imports from Latin America during the 1979-1987 period.** The EC imports only did better than those of the rest of the industrialised countries. USA imports from Latin America in 1987 were 113% more than they were in 1979 (Table 1.1). This corresponds to a 9.9% ARG (A.1.15) for the 1979-1987 period. Japanese imports from Latin America in 1987 were 64% more than their 1979 level (Table 1.1) which means a 6.4% ARG for the 1979-1987 period (A.1.29).

Although the value of their imports from Latin America also decreased sharply during 1986 and 1987, their 1985 peak was higher than that of the EC, at 315% for USA and 250% for Japan.

**The overall picture of the evolution of EC imports from Latin America however, is poorer if one examines its net of fuels imports.** Its 3.6% ARG is worse than the overall performance of total EC imports net of SITC 3 from Class 2 (7.15% ARG) the Mediterranean LDCs (9.7% ARG) and the Asian LDCs (11.1% ARG) and only better than those from the ACPs (2.05% ARG). This was due to the fact that while EC imports net of SITC 3 from Latin America contracted after 1985, those from Class 2, the Mediterranean and Asian LDCs remained stable on average (A.1.8).

**USA and Japan imports net of SITC 3 from Latin America (A.1.22 and A.1.36 respectively) also revealed a lower ARG than imports net of SITC 3 from Class 2 for the 1979-1987 period.** Once again in both these cases, while imports from Latin America contracted after 1985, imports from Class 2 as a whole continued to increase.

The evolution of EC imports from Latin America is much smoother if one examines it in terms of value defined in US dollars (Table 1.3). Indeed, after an increase in 1980, the value of EC imports from Latin America remained at roughly the same levels up to 1986 when it registered a decrease that was mostly recovered in the following year. US imports from Latin America increased steadily up to 1983 and spiralled upwards subsequently. Japanese imports on the other hand, increased from 1979 to 1987 with yearly or two-year cycles throughout the period.

## A.2.2. TRENDS OF EC EXPORTS TO LA20 (1979-1987)

**EC exports to Latin America in 1987 increased by 16% from their 1979 level** (Table 1.5) which represents a 1.9% ARG for the 1979-1987 period (A.1.2). The growth of EC exports to Latin America was clearly lower than that of its imports, with regular cycles. As a matter of fact, the overall picture was worse than that in any other developing region export market, save for the rather sudden fall of exports to ACPs in 1986 and 1987 (Table 1.5).

**Both USA and Japan exports to Latin America increased at a much quicker pace;** at a 4.4% ARG (A.1.16) and 5.6% ARG (A.1.30) respectively for the 1979-1987 period. Accordingly, USA exports to Latin America in 1987 were 141% their 1979 level, while Japanese exports were 155% their 1979 level (Table 1.4). This increase is all the more pronounced if one takes into consideration the fact that they both decreased significantly from their 1985 peak (185% for USA and 220% for Japan). While this USA performance was only just below its overall export performance in Class 2 (4.8% ARG for 1979-1987) Japan's was significantly poorer than the 8.3% ARG its exports to Class 2 exhibited during the same period.

As the EC, USA and Japan are not important exporters of fuels, the overall picture of exports net of SITC 3 to Latin America is not really different.

After an initial increase, all industrialised countries exports to Latin America defined in terms of US dollars (Table 1.6), plunged in 1982. In 1983, they were all below their 1979 level. EC exports to Latin America were the last to start recovering in 1985. In 1987, they were still just below their 1979 level.

## A.2.3. TRADE BALANCE OF EC-LATIN AMERICAN TRADE

**Latin America consistently enjoyed a positive trade balance vis-a-vis the EC throughout the 1979-1987 period** (A.1.3). The balance of EC trade with Latin America was increasingly negative up to 1985 since when it revealed a tendency towards becoming more balanced. Despite this tendency however, the EC has a relatively greater deficit with Latin America than with any other developing region or its balance of overall external trade (Table 1.7).

**Bilateral EC-Latin America trade excluding fuels (SITC 3) is slightly more balanced but still clearly favouring Latin America.** As a matter of fact, if one excludes trade in fuels, then the Latin America is the only developing region with which the EC has a negative trade balance (Table 1.8). Once again this evidence seems to underline the fact that tariff preferences can not in themselves guarantee that a trade relationship will favour the recipient country, although it may be argued that it may moderate the asymmetry in favour of the developed economy partner. Indeed, the EC enjoys the greatest trade surplus vis-a-vis the Mediterranean LDCs that are a preferred developing region in terms of access to the EC market and the Latin American LDCs have a more favourable trade balance with the EC than the ACPs that are at the apex of the EC's trade preferences.

The USA also has a negative trade balance with Latin America, which peaked in 1985 (A.1.17) a lot of which is attributable to imports of fuels from Latin America (A.1.24). Japan on the other hand, has a positive trade balance with Latin America (A.1.31) which becomes even more pronounced if one excludes trade in fuels (A.1.38).

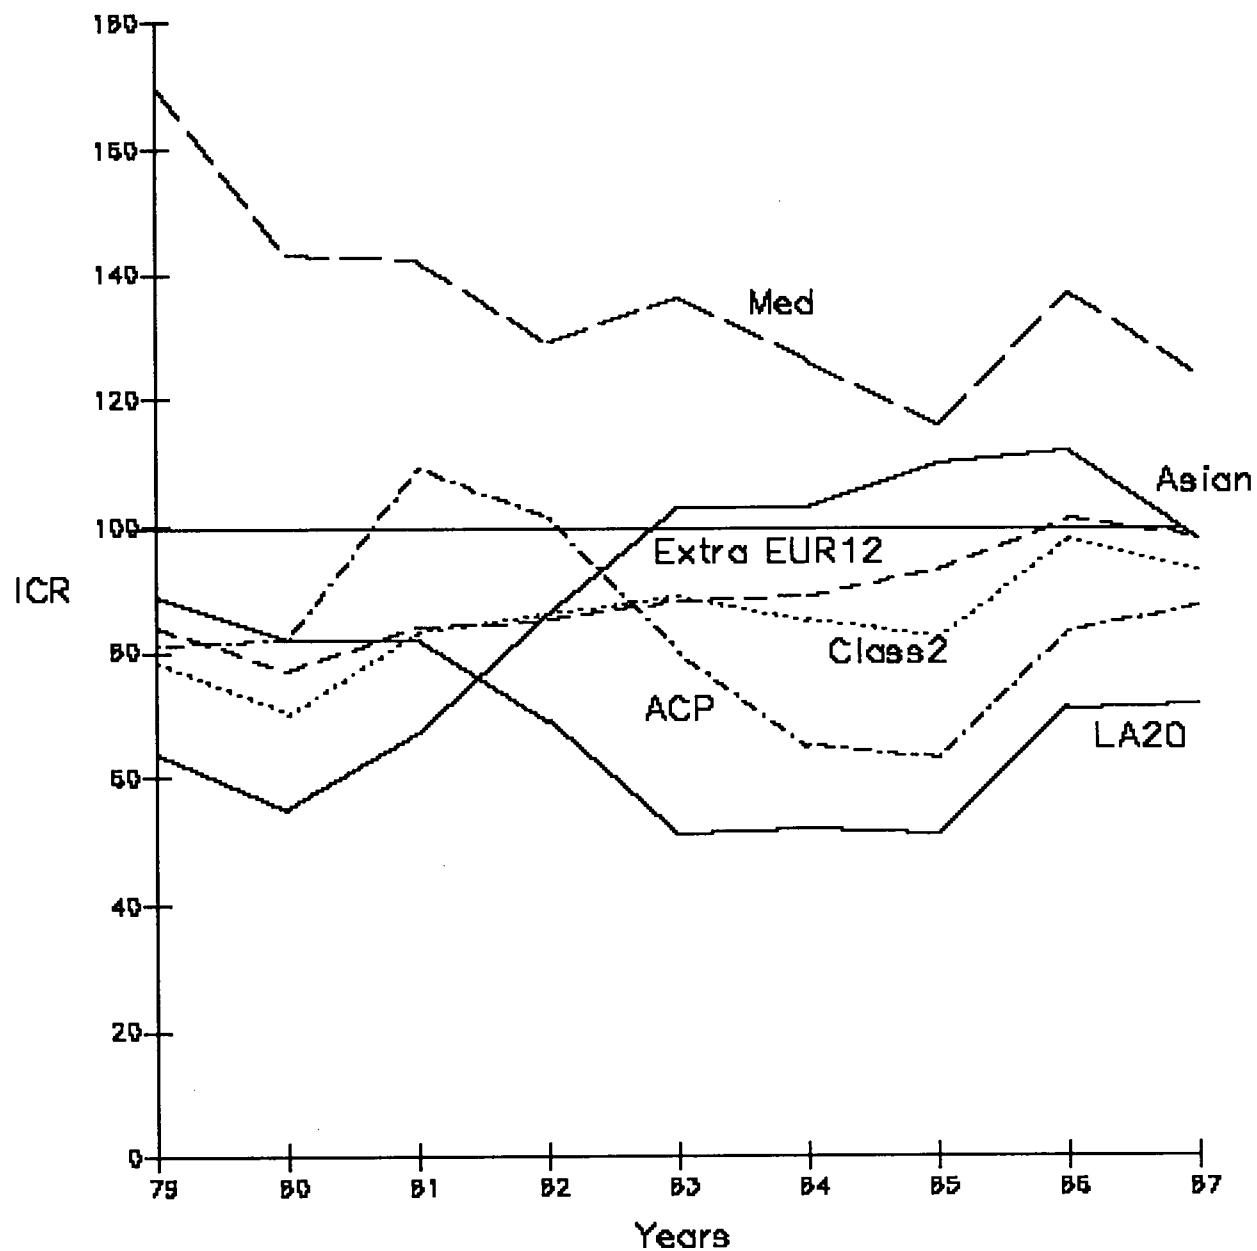

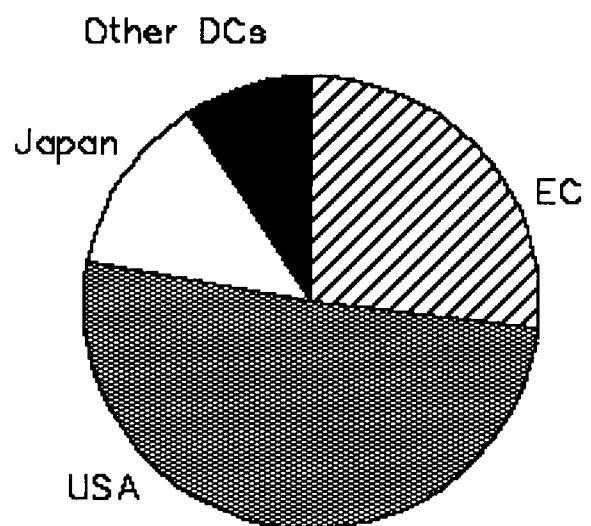

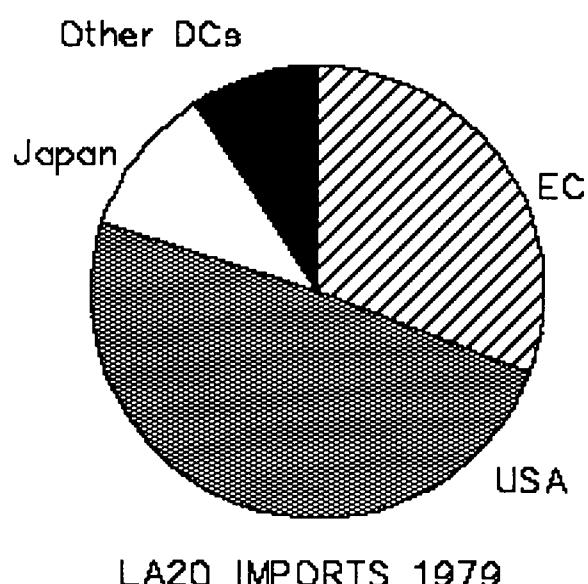

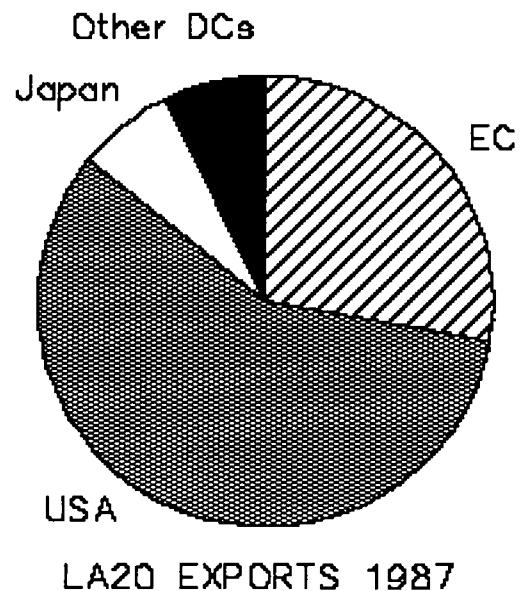

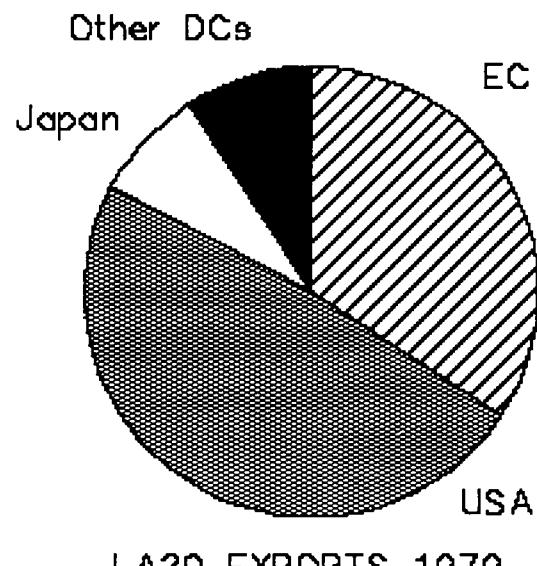

Illustration 1.3: LA20 Trade with Industrialised Countries

## **B. THE RELATIVE IMPORTANCE OF EC-LATIN AMERICA BILATERAL TRADE**

### **B1. EC IMPORTS FROM LATIN AMERICA**

#### **B1.1. LATIN AMERICA'S SHARE OF EC IMPORTS**

In 1987 Latin America accounted for 5.6% of total Community imports (A.1.4) and 17% of Community imports from Class 2 (A.1.6). If one excludes the Asian LDCs that represent over half the Community's imports from Class 2 (54.3% in 1987), Latin America is only marginally less important a supplier of the EC market than the Mediterranean LDCs (17.6%) and more important than the ACPs (14.1% in 1987).

This ranking however, understates its overall performance during the 1979-1987 period, because of the 1986 and 1987 sharp fall in its share. In 1985, Latin America was the second most important developing region supplier of the EC after the Asian LDCs, marginally better than the ACPs that were in the third position and the Mediterranean LDCs in the fourth position.

Even so, while the percentage share of EC imports from Latin America decreased during the 1979-1987 period by a -1% ARG (A.1.4) it increased with regards to EC imports from Class 2 by a 2.9% ARG (A.1.6).

Indeed, the 1979-1987 Latin America's ARG of the share of EC imports from Class 2 was positive, while that of the ACPs and the Asian LDCs was negative, only to be bettered by the Mediterranean LDCs' outstanding performance (5.6% ARG of their share of EC imports from Class 2 for the 1979-1987 period).

In comparison, Latin America's importance as a supplier is far more pronounced in the USA market where in 1987 accounted for 11% of the country's total imports (A.1.18) and some 30.8% of imports from Class 2 (A.1.20). Its overall importance decreased by a -1.1% ARG from its 1979 position but increased by a 2% ARG with regards to imports from Class 2. The peak of its importance was registered in 1983 with regards to total USA imports and in 1985 with regards to imports from Class 2.

Latin America's importance as a supplier is far more modest in the Japanese market where in 1987 it represented 4% of the country's imports (A.1.32) and 8.9% of imports from Class 2 (A.1.34). This was a slight increase from the 1979 position but an important increase with regards to the share of imports from Class 2 (by a 3.1% ARG for the period of 1979-1987). These shares however were at a decrease from the 1984 peak with regards to total Japanese imports and the 1986 peak with regards to imports from Class 2.

The percentage of SITC-3 EC imports from Latin America is at about the same overall level but rather more important with regards to imports from Class 2 (at 20.8% in 1987). This share contracted from 1979 to 1987 by a -3.3% ARG while that of the Mediterranean and Asian LDCs increased by 2.4% ARG and 3.7% ARG respectively (A.1.13).

It should be noted however, that both the USA and the Japanese SITC-3 shares of imports from Latin America also fell by -2.9% ARG and -4.3% ARG respectively (A.1.27 and A.1.41 respectively).

## B1.2. THE IMPORTANCE OF THE EC AS A LATIN AMERICAN EXPORT MARKET

The EC is the second most important industrialised country export market for Latin America, although its importance decreased during the 1979-1987 period. In 1987, the EC absorbed 28% of industrialised countries' imports from Latin America, as opposed to 58% of the USA but a mere 7% of Japan as well as the rest of the DCs. At the same time it absorbed a 35% of industrialised countries' imports from Class 2, which is between the 40% for the USA and 18% for Japan.

This figure represents a gradual reduction from the 1979 and 1982 figures, when it was absorbing 34% and 32% respectively of imports from Latin America. This reduction is in line with the shrinking of its percentage of industrialised countries' total imports and imports from Class 2. It should also be noted that the EC share had a continuous reduction of its relative share despite the rather sharp increase of its imports from Latin America up to 1985.

Indeed, the USA's 1982 and 1987 increase and Japan's 1982 increase and 1987 decrease of share was evident with regards to all destinations. (Table 1.9).

Another picture of Latin America's export orientation can be derived by examining its area intensity of trade in different industrialised countries' markets<sup>3</sup>. Although Latin America's export orientation towards the Community decreased slightly from its 1979 level, it is still greater than its overall strength as an exporter to the international market, that is one may conclude that LA20 has a moderate emphasis in the EC export market. By comparison, the Mediterranean LDCs and the ACPs exports are heavily concentrated on the EC market, an emphasis that further increased from 1979 in the first case and 1982 in the second (Table 1.10).

Latin American exports are clearly oriented towards the USA. The degree of emphasis in the USA market however, was moderated in 1982 and 1986. Latin American emphasis on the USA market is much greater than the emphasis placed in the USA market by Class 2 as a whole (Table 1.11). The Latin American countries command a smaller share of the Japanese market than their share of the world market. As a matter of fact, Latin American exports have a smaller intensity of trade in the Japanese market than Class 2 as a whole (Table 1.11).

The evidence from the examination of the area intensity of trade between various developed and developing regions lend support to the view that North-South trade is regionalised. Thus, while the EC is an especially important export market for the ACPs and the Mediterranean LDCs, Latin American exporters are heavily concentrated on the USA market. This regionalisation of international trade however, should not necessarily be wholly attributed to the geographical pattern

---

<sup>3</sup> Roemer (1977) suggests that an exporter's power in any export market is directly related to its intensity of trade in this area.

of tariff preferences granted by the developed economies. Less formal considerations may also provide an explanation on the creation and maintenance of North-South regional trade groupings<sup>4</sup>.

## **B2. EC EXPORTS TO LATIN AMERICA**

### **B2.1. EC'S SHARE OF INDUSTRIALISED COUNTRIES EXPORTS TO LATIN AMERICA**

The EC is the second most important industrialised country as a supplier of the Latin American market. This importance decreased substantially from 1979 to 1982 and only recovered marginally in 1987. While the EC represents 27% of industrialised countries' exports to Latin America in 1987, the corresponding figure for the USA is 51% and for Japan 13%. The EC share of DCs exports to Class 2 is much greater at 40%. The same is true for Japan (24%). On the contrary, the USA's share is comparatively much smaller than its Latin American share, at 25%.

USA's share of DCs exports to Latin America registered an increase from 1979 to 1982 and subsequently maintained the same share, while at the same time maintaining an almost stable share in exports to Class 2. Japan on the other hand, increased its share of exports to Latin America from 1979 to 1982 and had a slight decrease in 1987, while its share of DCs exports to Class 2 expanded steadily (Table 1.12).

### **B2.2. THE IMPORTANCE OF LATIN AMERICA AS AN EC EXPORT MARKET**

Latin America's importance as an EC export market is smaller than its importance as a supplier to the EC. In 1987, Latin America absorbed about 4% of the Community's total exports (A.1.5) and 13% of the Community's exports to Class 2 (A.1.7). This is about the level of the ACPs (13.1%) but it is much lower than that of the Mediterranean LDCs (23.5%) and the Asian LDCs (57%).

The EC's share of exports going to Latin America decreased from 1979 to 1987 by a -5.3% ARG (A.1.5). Such a reduction of the share of EC exports to Latin America is noticeable with regards to all developing regions although the fall was greater than that of the Class 2 share as a whole (-3.4% ARG). The share of EC exports to Latin America peaked in 1981 and spiralled down subsequently. Even as a percentage of exports to Class 2 however, EC exports to Latin America decreased by almost -2% ARG during the same period (A.1.7). Only exports to the ACPs fared worse (-2.7%) while the share of exports to the Asian LDCs increased by 2.6% ARG.

<sup>4</sup> Such considerations relate to "non-price" aspects of trade decisions. These aspects influence an exporting country's relative competitiveness in a given market, beyond comparative cost considerations and the existing tariff and non-tariff barriers to trade, by way of affecting the behavioural, marketing and consumer preference aspects of a bilateral trade relationship. There are a number of determinants of the non-price aspects of an economy's relative competitiveness vis-a-vis another economy, such as the geographical distance between the two economies (a combination of the physical distance and its features) and existing historical, cultural, commercial and foreign direct investment links. In fact, the combination of relative costs, tariff and non-tariff barriers to trade as well as non-price aspects of competition determine the comparative advantage that effectively regulate international trade patterns. From an extensive literature on the subject see: Koutsoyannis (1982) Non-Price Decisions Macmillan, London; Porter (1980) Competitive Strategy Free Press, NY; Porter (1985) Competitive Advantage Macmillan, London; Reid (1981) "The Decision-Maker and Export Entry and Expansion" Journal of International Business Studies; Roemer (1977) "The Effect of Sphere of Influence and Economic Distance on the Commodity Composition of Trade in Manufactures" The Review of Economics and Statistics.

At the same time, USA exports to Latin America as a share of exports to Class 2 increased by a 2% ARG (A.1.20) from the already prominent position of 30.8% of 1987. The corresponding Japanese share however, contracted by a -2.4% ARG (A.1.35) from the rather modest position of 10.4% in 1987.

An examination of the area intensity of trade shows that **the EC's share in the Latin American market is more or less the same as its overall share in the world market**, although in 1982 and to a lesser extent in 1986 it was relatively smaller than in 1979 . By comparison, it tends to command a clearly larger share in the markets of the ACPs and the Mediterranean LDCs, a tendency that in 1986 was even more pronounced than in 1979 (Table 1.13).

As expected, the USA shows a high degree of specialisation in the Latin American market, one that is greater than its observed specialisation in Class 2 as a whole (Table 1.14).

Japan had some slight specialisation tendency in the Latin American market in 1979 and 1982, which disappeared in 1986. On the other hand, it has a much greater emphasis in exporting to Class 2, although this tendency is gradually being moderated (Table 1.14).

These evidence demonstrate that North-South trade regionalisation exists with regards to the developed countries' exports just as well as with their imports from the South. Thus, while EC exports tend to specialise in the Mediterranean and ACP markets, they place no special emphasis on the Latin American market. Contrary to that, the USA exports specialise heavily in Latin America.

Furthermore, the observed two-way regionalisation underlines the fact that tariff preferences in themselves can not be held as the sole cause of the creation of North-South trade blocks since the exports of the donor industrialised economies are regionally concentrated although they enjoy no reciprocal preferential treatment from the recipient developing economies<sup>5</sup>.

## **C. TRADE BETWEEN THE EC AND DIFFERENT LATIN AMERICAN SUB-REGIONS**

### **C1. THE RELATIVE IMPORTANCE OF THE VARIOUS LATIN AMERICAN SUB-REGIONS**

Latin America is far from being a homogeneous group. It includes all types of LDCs, from small land-locked and island economies that find it difficult to initiate a process of self-sustained growth, to NICs with gigantic economic potential. Accordingly, it is only natural that they will have a different external trade performance.

**ALADI** (which anyway comprises 15 out of the 20 LA20 countries) is the single most important source of EC imports from Latin America accounting for 91.5% in 1987. Almost two thirds of this share however, represent imports from the three Latin American NICs. CACM represents a very modest share (4.6% in 1987), only marginally more than the remaining Latin American LDCs (Cuba,

<sup>5</sup> This phenomenon may be explained in static terms by a greater relative competitiveness associated with non-price aspects of competition and in dynamic terms by the generation of "implicit reverse preferences" whereby the donor economy's non-price aspects of relative competitiveness are improved as a result of increasing trade contacts to the extent that non-reciprocal tariff preferences granted by the developed economy lead to gross trade creation. For an extensive discussion of the phenomenon of implicit reverse preferences see: Tsoutspilides (1989) Regionalism and Globalism in the Design of the EC Development Cooperation Policy unpublished PhD Thesis, University of Reading.

Haiti, Dominican Republic and Panama) that represent some 3.9% of EC imports from Latin America (Table 1.15).

**ALADI is also the most important EC export market absorbing 87% of EC exports to Latin America in 1987.** Here the relative share of Latin American NICs is more modest although it still accounts for half the Community exports to Latin America. CACM is just as modest an export market as a supplier, only now less important than the rest of the Latin American LDCs (Cuba, Haiti, Dominican Republic and Panama) which account for almost double the CACM share of EC exports to Latin America (4.3%) (Table 1.16).

**The position of the EC as an importer from various Latin American sub-regions relatively to the other DCs is most important for the Latin American NICs and ALADI, although it is continually decreasing as opposed to the percentage absorbed by the US that is on the increase.** A third of DCs imports from CACM went to the EC in 1979, which was almost a quarter in 1987, which is about the percentage for the Andean Pact (Table 1.9).

In 1979, almost a third of the industrialised countries' exports to LA NICs, ALADI and the Andean Pact and a quarter of those to CACM came from the EC. By 1987 the EC was providing around a quarter of the industrialised exports to all Latin American regions, save for the Andean Pact, where the EC still provided a third of the total DCs exports there. Both USA and Japan were the beneficiaries of the rather sharp fall in the EC share between 1979 and 1982 (Table 1.12).

## **C2. TRENDS IN TRADE BETWEEN THE EC AND DIFFERENT LATIN AMERICAN SUB-REGIONS**

The trends in the evolution of the EC trade with all Latin American regions during the 1979-1987 period are similar, albeit at different intensity.

**During the 1979-1987 period EC imports from the Latin American NICs increased at an impressive 6.6% ARG. Imports from the Andean Pact increased by a 2.35% ARG, while imports from CACM actually decreased by a -1.2% ARG (A.1.1).**

Although the percentage share of all Latin American sub-regions in total EC imports fell from 1979 to 1987, that of the Latin American NICs registered an increase (at a 0.8% ARG) (A.1.4) thus increasing their percentage among EC imports from Class 2 by an impressive 4.8% ARG (A.1.6).

If one examines EC imports net of SITC 3 from Latin America, then there is a clear decrease in all region's share of EC imports during the 1979-1987 period (A.1.11). What is more, the decrease is also noticeable by reference to imports from Class 2 (A.1.13) although it is slightly more moderate. EC imports from CACM are the most heavily affected from this trend.

**The importance of all Latin American regions as EC export markets decreased sharply in the 1979-1987 period.** Most noticeable is the decrease of the share of the LA NICs (A.1.5) which is also

noticeable even if one compares it to EC exports to Class 2 (A.1.7). At the other end, where the share decreased at a slightly more moderate pace, was in the CACM market.

**EC exports to the Latin American NICs, the ALADI and the Andean Pact increased from 1979 to 1987 at modest rates (1.3%, 1.5% and 1.7% ARG respectively). Exports to CACM on the other hand, increased much quicker, at a 3.6% ARG (A.1.2).**

### **C3. THE TRADE BALANCE BETWEEN THE EC AND VARIOUS LATIN AMERICAN SUB-REGIONS**

The EC has a negative trade balance with all Latin American regions examined, except for the Andean Pact. The trade deficit is more pronounced with the Latin American NICs, that in 1987 exported to the Community almost double as much as they imported from there. CACM in 1987 had exactly the same trade balance with the EC as the Latin America as a whole (Table 1.7).

The Community's trade balance with the Latin American NICs became increasingly negative up to 1985 when the Community imported from there almost three times as much as it exported, with the trend being reversed subsequently.

The Community's positive trade balance collapsed into importing twice as much as exporting to the CACM in 1983, but has recovered its positive trade balance by 1987.

Among LDC regions, the Andean Pact's exports to the EC have the most significant fuels content. Thus, the balance of their bilateral trade net of SITC 3 differs substantially. Indeed, the EC surplus with the region increases from a 113 ICR in 1987 (Table 1.7) to a 159 (Table 1.8). Trade in fuels also affects trade between the EC and Latin American NICs, but on a much smaller scale. The EC negative trade balance with this region becomes slightly more balanced in SITC-3 trade; a 57 ICR for the EC in 1987 becomes 68.

### **D. EC TRADE WITH LATIN AMERICA AFTER THE 1986 ENLARGEMENT**

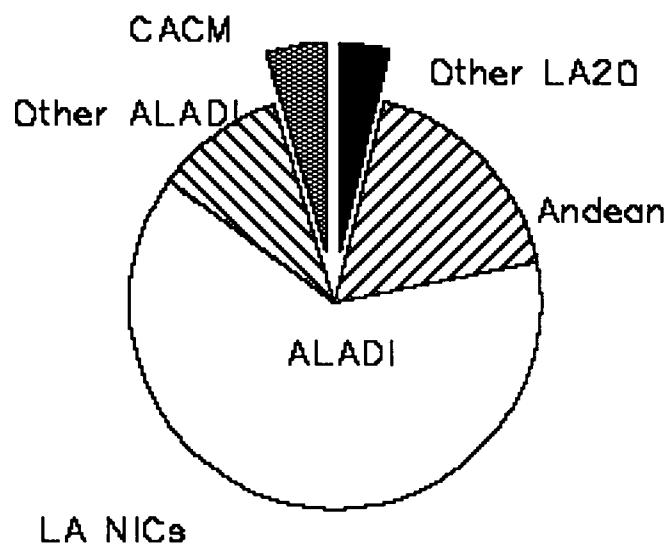

For the greatest part of the period under examination Portugal and Spain were not members of the Community. Moreover, they are countries with a special historical and cultural relationship with Latin America. It is thus interesting to the discerning reader to provide some information about the relative share in the EC-Latin America trade of Spain, Portugal and the rest of the EC member states (EC10).

Spain's percentage share of EUR12 imports from Latin America fluctuated between 12% and 16%. Where this percentage was significantly greater was in imports of fuels, where it was between 27% and 36% (Table 1.17).

Its share of the EUR12 exports to Latin America was more modest at between 9% and 13%. A greater share can be observed in exports of fuels, where it reaches 20% in 1985 (Table 1.18).

Portugal's share is naturally much smaller. It has been at a steady 2% of EUR12 imports from Latin America throughout the 1980-1987 period, and between 0% and 1% of exports. These shares are between double and quadruple in trade in agricultural raw materials.

## **PART TWO: THE STRUCTURE OF EC-LATIN AMERICA TRADE**

### **A. THE STRUCTURE OF EC IMPORTS FROM LATIN AMERICA**

#### **A1. THE COMPOSITION OF EC IMPORTS FROM LATIN AMERICA**

EC imports from Latin America reveal the product composition one would expect from imports of an industrialised economy from LDCs. **Almost half of EC imports from Latin America (46%) in 1987 were food items. Three other categories shared the second position; namely, fuels and manufactures with 17% and ores and metals with 16%. Lastly, 5% were agricultural raw materials.**

More than a quarter of the Community food imports from Latin America in 1987 were covered by coffee (12% of total EC imports from LA20 in 1987) while oilseed cake represented 7%. Textiles, machinery and transport equipment, each represented 3% of total 1987 EC imports from Latin America, while chemical products represented 2% of EC imports. **Some 3% of 1987 Community imports from Latin America could be characterised as high technology produce.** (Table 2.1)

#### **A2. LATIN AMERICA'S SHARE OF EC IMPORTS BY PRODUCT CATEGORIES**

**About a quarter of EC's imports of food items come from Latin America. This makes Latin America the most important supplier of food items among developing regions by representing about half the EC's imports from Class 2 (A.2.13).**

Only about 5% (4.5% in 1987) of the EC's imports of **agricultural raw materials** come from Latin America. This represents less than a fifth the EC's imports of this group of products from Class 2. Moreover, the percentage imported from Latin America revealed a tendency towards decreasing in the 1979-1987 period (A.2.14).

Most of the EC's imports of **fuels** come from Class 2 (more than 80% in 1979 and 60% in 1987). Although the percentage coming from Latin America is rather moderate (5.39% of total EC imports in 1987) there was a marked increase in its relative importance in the 1979-1987 period (A.2.15).

**About a third of the EC's imports of ores and metals come from Class 2. Almost half of this comes from Latin America.** The second most important developing region supplier is ACP, representing about a third of the EC's imports of ores and metals from Class 2 (A.2.16).

Latin America is a very small supplier of manufactures to the EC (1.65% of its total imports and 7.5% of its imports from Class 2 in 1987). Moreover, its relative importance as a supplier of manufactures during the 1979-1987 period experienced a reduction (A.2.17).

**The EC imports from Latin America specialise in food items and ores and metals.** The specialisation in these product groups is not only highest than in imports from any other developing region, but they are also on the increase. The highest degree of specialisation is in imports of coffee, where Latin America's share of EC imports was in 1987 ten times its overall share of EC imports. Similarly high levels of specialisation may be observed in EC imports of oil seed cake from Latin America. Among ores and metals, the EC specialises highly in the import of iron ore and copper from Latin America.

The region from where the pattern of specialisation of EC imports is most similar is the ACPs. The only differences from the product specialisation in imports from Latin America are a smaller degree

of specialisation in coffee and iron ore, no specialisation in oil seed cake, and a degree of specialisation in imports of agricultural raw materials and fuels. By comparison, imports from the Mediterranean and Asian LDCs only specialise in fuels and textiles and clothing. (Table 2.2)

### **A3. THE RELATIVE IMPORTANCE OF THE EC AS A LATIN AMERICAN EXPORT MARKET BY PRODUCT CATEGORIES**

An examination of the sector balance of trade shows that the **sectoral composition of Latin American exports to the EC is more "unbalanced" than those to the USA and Japan**; that is they reveal greater differences on the degree of concentration on exports of different broad product groups. Moreover, not only there was no evidence of sectoral diversification of Latin American exports to these three important markets, but concentration showed an increase from 1982 to 1987 (Table 2.3). This is only tentative evidence however, as solid conclusions on this question can not be reached unless a much more detailed analysis is conducted at a more disaggregated level.

**Latin American exports to the EC are heavily concentrated on food items.** A similar emphasis is observed in exports to USA and Japan, although this is more modest in the case of USA and only just identifiable in the case of Japan. In all three cases however, there was an increase of this concentration from 1982 to 1987. Exports to the USA also seem to emphasise fuels, which is not the case with exports to either the EC or Japan. **Latin American exports to the EC also concentrate on ores and metals** although this emphasis is only half the extent of emphasis that is placed on this sector when it comes to exports to Japan. It is interesting to note the degree of \*counterspecialisation Latin American exports show in the manufacturing sector in all three important industrialised countries markets (Table 2.3).

**In 1979, four sectors of Latin American exports revealed a tendency to specialise in the EC market. These were the following, in order of the magnitude of specialisation: Ores and metals, manufactures, food items and at a lower scale exports of agricultural raw materials. By 1987, only two sectors revealed an emphasis in the EC market. Food items exports, that have now increased their emphasis thus taking the first place and exports of ores and metals that have now slipped into second position with their emphasis on the EC market being moderated.**

By comparison, all ACP and Mediterranean LDCs export sectors reveal a much greater degree of emphasis on the EC market. Contrary to that, the Asian LDCs only focus their exports of manufactures on the EC market; even this focus however steadily decreasing (Table 2.4).

### **A.4. THE EVOLUTION OF THE PRODUCT CATEGORIES STRUCTURE OF EC IMPORTS FROM LA20 (1979-1987)**

**All sectors of EC imports from Latin America, except miscellaneous products, peaked at 1985 and suffered reductions of various degrees in the next two years, with the exception of manufactures that in 1987 recovered at exactly their 1985 level.**

**The greatest volatility was observed in imports of fuels** that in 1985 almost reached seven times their 1979 level, in order to subsequently shrink at two and a half their 1979 level in 1987. (Table 2.5)

In fact, changes in the value of EC imports of fuels are the single most important reason for the observed sharp increase of EC imports from Latin America in the 1979-1985 period and the equally sharp decrease in the following two years (Table 2.6). Indeed out of a 126% percentage variation between 1979 and 1985, fuels accounted for 55%. Similarly, the drop in the value of fuels imported by the EC, accounted for half the -36% percentage variation between 1985 and 1987.

The second sector responsible for the pattern of the evolution of EC imports from Latin America is food items. Imports in this sector accounted for almost a third of the 1979-1985 rise and more than a third of the 1985-1987 fall.

Ores and metals contributed 15% of the 126% 1979-1985 rise and 4% of the -36% reduction in the 1985-1987 period. Lastly, manufactures and agricultural raw materials contributed 11% and 4% respectively into the 1979-1985 126% rise.

The sectoral decomposition of the evolution of EC imports in the two distinct periods of the 1979-1985 rise of EC imports from Latin America and the 1985-1987 fall provide some very interesting information. One can observe that the sectors that have been responsible for the 1979-1985 increase of EC imports from Class 2 are the same sectors that have been responsible for the increase of the EC imports from Latin America. Similarly, it was the same sectors that have led to the decrease in the subsequent two years. Consequently, it may be argued that **the fact that EC imports from Latin America exhibited a notable degree of volatility over the 1979-1987 period**, with a sharp increase up to 1985 and an equally sharp subsequent reduction, **may be attributed to the structure of the EC imports from Latin America**. Indeed, EC imports from Latin America tend to specialise in exactly those sectors that exhibited the greatest degree of volatility, that is food items and fuels. Moreover, what accentuated in relative terms the 1985-1987 reduction of EC imports from Latin America is the fact that there was a relatively smaller emphasis in imports of manufactures, a sector in which EC imports continued to increase throughout 1986 and 1987. Having established then that the observed volatility of EC imports from Latin America has been mostly due to exactly the product composition of EC imports from Latin America, one can determine whether this pattern is mostly due to price changes or to changes in the demand of the EC, by reference to the unit of value of the goods traded, a question that will be addressed in Part Three of this analysis.

## B. THE STRUCTURE OF EC EXPORTS TO LATIN AMERICA

### B1. THE COMPOSITION OF EC EXPORTS TO LATIN AMERICA

The bulk of EC exports to Latin America are manufactures; representing some 82% of total exports in 1987. Nearly half of these are machinery (37% of the total exports in 1987). Almost a fifth is chemicals (19% of the total in 1987) with the rest being transport equipment (12% in 1987) and other manufactured products (10% in 1987). More than a fifth (21%) of total EC exports in 1987 were high technology products. Metals and food items accounted for practically all the rest of EC exports to Latin America in 1987. (Table 2.7)

## **B2. THE RELATIVE IMPORTANCE OF LATIN AMERICA AS AN EC EXPORT MARKET BY PRODUCT CATEGORIES**

**Latin America absorbed in 1987 3.56% of the EC's exports of food items, 3.19% of exports of agricultural raw materials, 1.38% of exports of fuels, 4.14% of exports of ores and metals and 4.24% of its exports of manufactures (A.2.19 to A.2.23).**

**In 1982 EC exports to Latin America specialised in ores and metals, manufactures and miscellaneous products.** The emphasis in ores and metals was increased in 1986, while that of manufactures and miscellaneous products had effectively disappear. This pattern of structural emphasis is not unsimilar to that of EC exports to other developing regions, save for a rather greater emphasis in exports of ores and metals to Latin America (Table 2.9).

**Of all the sectors of EC exports it tends to concentrate in the Latin American market its exports of ores and metals;** a relative emphasis that increased in 1982 and 1986. All EC export sectors focus on the ACP and Mediterranean markets, while only exports of food items and manufactures concentrate in the markets of the Asian LDCs (Table 2.10).

## **B3. THE EC COMPARED TO OTHER SUPPLIERS OF LATIN AMERICA BY PRODUCT CATEGORIES**

**The EC's exports to Latin America are more sectorally balanced than its imports from that region.** Moreover, while its imports from there revealed a tendency to become more concentrated, its exports have become more diversified from 1982 to 1987. The same trend was revealed with regards the product composition of USA and Japanese exports to Latin America. While USA exports to Latin America are more "balanced" sectorally, Japan's are less balanced (Table 2.8).

**Latin American imports from the EC had a slight tendency in specialising in manufactures.** This specialisation however was all but gone by 1986. The share of manufactures imported by Latin America from the USA is practically the same as USA's overall share in Latin American imports. By contrast, imports from Japan started specialising in manufactures in 1982 and 1986.

**Both imports from the EC and Japan specialise in ores and metals.** The difference is however, that whereas in the case of the EC this specialisation started in 1982 and increased in 1986, in the case of Japan a notable degree of specialisation in 1979 was almost gone by 1986.

On the contrary, USA exports to Latin America tend to specialise in different sectors, namely food items and agricultural raw materials. In 1986, a focus on exports of fuels also appeared (Table 2.8).

#### B4. THE EVOLUTION OF THE PRODUCT COMPOSITION OF EC EXPORTS TO LATIN AMERICA (1979-1987)

EC exports to Latin America exhibited a much more even evolution than its imports from this region. Moreover, the evolution of exports of each sector involved cycles that did not correspond with each other. While exports of food items, ores and metals and manufactures had their highest value in 1981, exports of agricultural raw materials and fuels had their greatest values in 1986 and 1985 respectively (Table 2.11).

If 1979-1985 and 1985-1987 are still adopted as two sub-periods in order to assess the evolution of EC exports to Latin America, since overall EC exports revealed a tendency to increase during the first and fall in the second, then one observes the same pattern as that for overall EC exports to Class 2. **Out of a 29% percentage variation of EC exports to Latin America from 1979 to 1985, exports of manufactures accounted for 26%. Out of a -10% decrease in 1986 and 1987, 9% is represented by a fall in the exports of manufactures.** Manufactures also played the most important role in the overall 1979-1985 increase of EC exports and the 1985-1986 decrease.

Exports of the EC to Class 2 revealed the same increasing tendencies during the 1979-1985 period and decreasing in the 1985-1987 period. Furthermore, most trends were mostly due to changes in the value of EC exports of manufactures to Latin America. The basic difference however is that the percentage variation of EC exports to Class 2 in both cases was about double that of EC exports to Latin America. (Table 2.12)

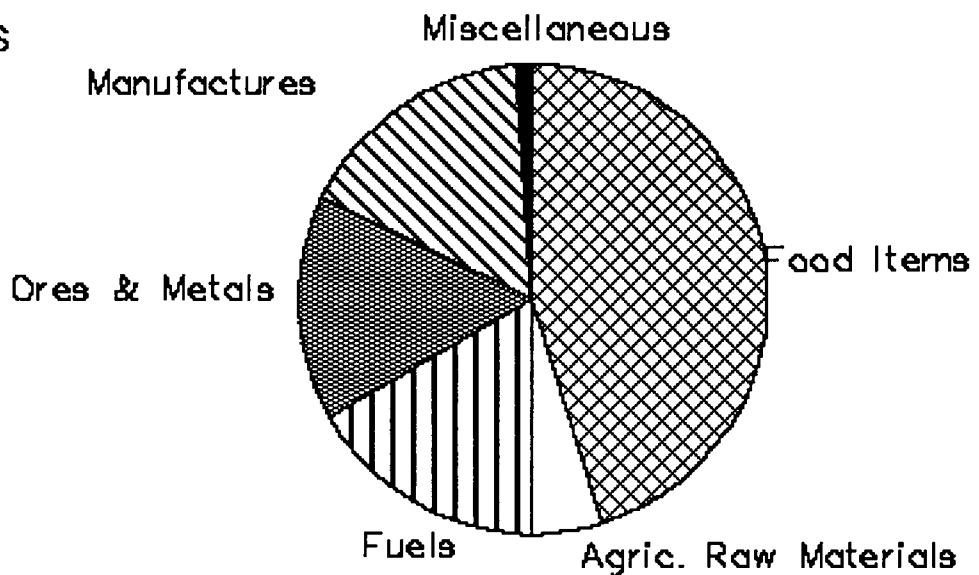

#### C. THE STRUCTURE OF EC TRADE WITH LATIN AMERICA

The structure of EC-Latin American bilateral trade illustrates all the features common in trade relationships between developed and developing economies, only to a more extreme degree. **The Latin American countries tend to have a massive trade surplus in bilateral trade in food items, agricultural raw materials, fuels, ores and metals, while they tend to run a sizeable trade deficit in bilateral trade of manufactures.**

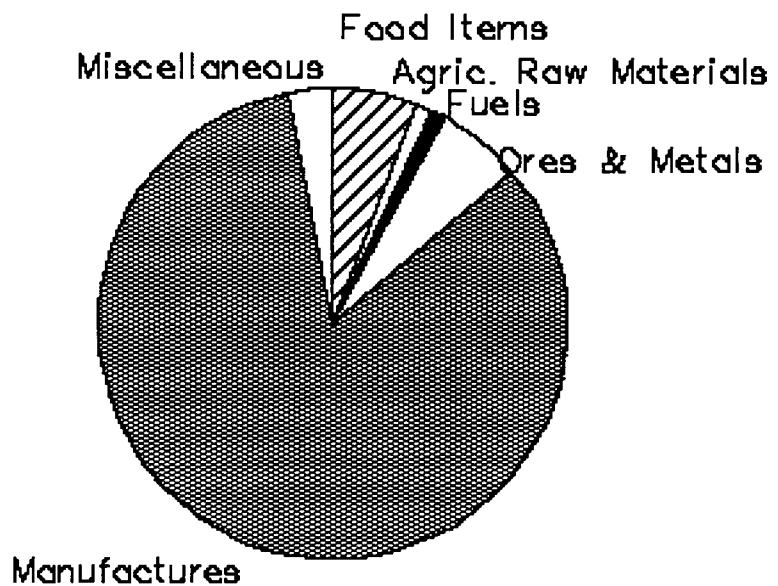

The EC imports ten times as much **food items** from Latin America as it exports there. When it comes to Class 2 it imports about twice as much as it exports there. The EC imports five times as much as it exports **agricultural raw materials** to Latin America, but four times as much with regards to Class 2 as a whole. The EC ICR in trade of **fuels** with Latin America is at about the same level as trade with Class 2 as a whole. The EC's significant deficit in trade in **ores and metals** with Latin America contrasts clearly with a far more moderate deficit in trade with Class 2, which as a matter of fact was turned into a trade surplus in 1981 and 1982. On the other hand, the EC's surplus in trade in **manufactures** with Latin America is far more pronounced than the surplus it runs with Class 2 as a whole. (Table 2.13)

**Illustration 2.1: Structure of EC Trade with LA20 (1987)**

## **PART THREE: ANALYSIS OF EC-LATIN AMERICA TRADE BY INDIVIDUAL PRODUCTS**

### **A. EC IMPORTS FROM LATIN AMERICA**

One can observe that there exists a rather high percentage concentration in the EC imports from Latin America in terms of products. The first two products accounting for over a quarter of the EC imports, the first three over a third, the first seven over half, the first twenty four over two-thirds. In fact, each one of the thirty most important products has a share above 0.50% of the total EC imports from LA.

The products actually chosen to be examined individually are slightly different to the 5-digit ones appearing in Table 3.1. An aggregation at the 4-digit, 3-digit, or even 2-digit levels was made in cases where the 5-digit components were traded significantly. This was done in order to increase the coverage scope of the examination.

Some features of the total group of the products that are subsequently examined individually appear in Table 3.2. From the evolution of the value of EC imports of these products one may note that there exists an increasing trend up to 1985, a sudden drop in 1986 and a further but smaller one in 1987. This trend is in line with the trend observed in total EC imports from Latin America (Part One).

In illustration 3.1 the relationship in changes between 1979 and 1987 in the unit values and the quantities imported of individual products is examined.

The greatest number of the individual products imported by the EC from Latin America that were examined here, experienced both an increase in the quantity exported and their unit value from 1979 to 1987, the latter trend being even more pronounced than the first.

Two products (Cocoa and coffee extras) experienced a decrease in both.

Four products' (coffee green, soya beans, leather and crude petroleum) unit values fell, while the quantities imported increased.

Four products' (raw cotton, unprepared meat, unmanufactured tobacco and leather footwear) unit values increased while the quantities imported decreased.

In illustration 3.2 the relationship in changes between 1979 and 1987 in the share of each individual product in total EC imports from LA20 and the share of imports from LA20 in total EC imports of the individual product in question.

The EC import structure focused more from 1979 to 1987 on LA20 as opposed to Class 2, in the case of the following products: fish, shellfish, bananas, orange juice, soda bleached, motor vehicle piston engines, road vehicles and leather footwear. The opposite happened in the case of pig iron.

EC imports in the following products got worse for both LA20 and Class 2: coffee extracts, cocoa, raw cotton and leather. For the remaining products the relative changes between 1979 and 1987 were not very significant as one observes them being clustered around the intersection of the axes.

### **MEAT**

Latin America is almost the exclusive supplier among the developing countries of EC imports of meat (both **fresh** and **prepared** 011 and 014) and a very important overall supplier, especially for prepared meat. Meat accounts for some 4% of EC imports from LA20.

A 20% increase of the value of EC imports of fresh meat from 1979 to 1987 was due to a doubling of its unit value although the actual quantities supplied were reduced.

On the contrary, both the quantities of EC imports of prepared meat from LA20 and their unit values increased, making for a 67% increase of the value imported from 1979 to 1987.

## FISH

**Fish and crustaceans and molluses** (034 and 036) accounted for about 2% of EC imports from Latin America in 1987, as opposed to 1.3% in 1979. The Latin America's share of EC imports in these sectors however, was actually reduced, in the second case by as much as 50%.

While both the quantities and the unit values of EC imports of fish from LA20 increased, the quantities of shellfish remained at similar levels (despite a slump up to 1985) their unit values increased considerably.

## FRUITS

More than half the EC's imports of **bananas** (0573) come from LA20, accounting for 3.5% of EC total imports from there in 1987. This share increased from 2.5% in 1979. This increase is a reflection of a doubling of the value of EC imports of bananas from LA20, an increase that is exclusively attributable to increases in their unit values.

**Apples** (057.40) constitute only 0.7% of EC imports from LA20, but it is practically the exclusive Class 2 supplier to the EC. The value of this trade increased by 75% from 1979 to 1985 as a result of an expansion of the quantities imported.

**Orange juice** (058.51) doubled its share in total EC imports from LA20 to 1.5% in 1987. LA20 supplies 70% of EC's imports from Class 2 and 65% of total EC imports. The value of this trade almost tripled from 1979 to 1987, both as a result of an expansion in the quantities imported and an increase in its unit values.

## COFFEE

Over half of EC's imports of **coffee green** (071.11) from Class 2 comes from LA20, accounting for 12% of the Community imports from there in 1987. In 1979 it was 15% of the EC imports from Latin America, the reduction being realised exclusively in 1987, as a result of a virtual halving of its unit value.

**Coffee extracts and essences** (071.20) constitute a very small trade (only 0.3% of the EC imports from LA20). LA20 lost its 1979 position as the sole Class 2 EC supplier. Moreover, the actual quantity of the EC imports shrank considerably, making the value of the EC imports in 1987 only a 60% of the 1979 level.

## COCOA

EC imports of **cocoa** (072.1 and 072.3) from LA20 are on the retreat. Comparing 1987 to 1979, it is 0.6% of total EC imports from LA20 (less than 1/3 of 1979), its market share halved from 15%, the value of EC imports of cocoa from LA20 halved, as a result of a combination of a fall in the quantities imported and their unit value.

## FEEDING STUFF FOR ANIMALS

**Feeding stuff for animals** (081) is an increasingly important sector, accounting almost for 10% of EC imports from LA20. Imports from LA20 represented more than 80% of EC imports from Class 2, compared to 70% in 1979. In 1987, the value of this trade was 55% more than in 1979, having peaked at 133% more in 1985. This increase represents almost exclusively an increase in terms of quantities imported.

## TOBACCO UNMANUFACTURED

Almost half the EC's imports of **unmanufactured tobacco** (121) from Class 2 come from LA20, making 2% of EC imports from LA20.

Although the quantities imported registered a decrease, the rise in the unit value made for a 36% in 1987 compared to 1979, having reached double the 1979 value in 1985.

### SOYA BEANS

Among Class 2, LA20 is the exclusive EC supplier of **soya beans** (222.20). This accounted for almost 4% of the 1987 EC imports from LA20, down from 5% in 1979, despite falling to 1% in 1982. This extreme volatility actually represents changes in the quantities imported.

### CHEMICAL WOOD PULP BLEACHED

LA20 is almost the exclusive EC supplier of **bleached chemical wood pulp** (251.72) among developing regions, though accounting for a mere 6% of total EC imports in 1987. It is 1% of total EC imports from LA20, while in 1979 represented a mere 0.5%. Both quantities imported and their unit values almost since 1979, making for a 162% increase in the value of imports having peaked in 1984 at 358% its 1979 level.

### RAW COTTON

**Raw cotton** (263.1) is a product whose importance is fading away in the last two years of the period. Indeed, since 1985, the quantities imported fell to less than a third, the value of this trade falling to a fifth. While LA20 supplied a fifth of the EC imports of raw cotton (almost a third of the imports from Class2) these shares fell to 6.2% and 11.3% respectively by 1987.

### IRON

LA20 is an increasingly important EC supplier of iron. While LA20 supplied 62% of **iron ore concentrates** (281.50 + 281.60) and 30% of **pig iron** (671) EC imports from Class 2 in 1979, by 1987 it was 70% and 50% respectively. Both quantities imported and unit value increases are responsible for these rises.

Imports of iron ore concentrates represent 5% of EC imports from LA20, while those of pig iron a mere 0.7%.

### BASE METALS ORES CONCENTRATES

**Base metals** (287) accounted for 3.6% of EC imports from LA20 in 1979, falling to 2.4% in 1987. LA20 supplies some 40% of the Community imports of the product from Class 2. The value of this trade in 1987 was at its 1979 levels.

### COPPER UNREFINED

LA20 provides a third of the EC imports of **unrefined copper** (682.11+682.12) and half of that supplied by Class2. This accounted for 4% of EC imports from LA20 in 1987, a fall from its 5.7% level in 1979.

### PETROLEUM

In 1987, the EC imported three times as much **crude petroleum** (333.0)from LA20 than in 1979. This rise made LA20 an important supplier with a tenth of the EC imports from Class2. Moreover, crude oil's share in EC imports from LA20 in 1987 was 15%, compared to 6% in 1979, but a staggering 26.6% in 1981. The fall from its maximum levels in the mid-1980's however is due to the fall in the unit value of oil.

**Petroleum refined products** (334) also used to be important EC imports from LA20 (6% of total EC imports from LA20 in 1980) but it has gradually decreased (1% in 1987). This fall represents a decrease in the quantities imported by the EC, which in 1987 were half the 1979 level. Moreover, while LA20 accounted for 14% of EC imports from Class 2 in 1979 and nearly 20% in 1981, its share shrunk to a mere 4% in 1987.

## **LEATHER**

Almost a quarter of the EC's imports of **leather** (611) from Class 2 in 1987 came from LA20, a share that has decreased from 1979 when it was more than a third. This decrease is mostly due to a fall in the quantities imported.

Some 14% of the EC imports of **leather footwear** (851.02) from Class 2 in 1987 came from LA20, a share that was half its 1979 level. Despite this loss in market share, the value of leather footwear imported from LA20 increased by 55% from 1979 to 1987, despite a reduction in the quantities imported. Indeed, the unit value of these imports doubled in this period.

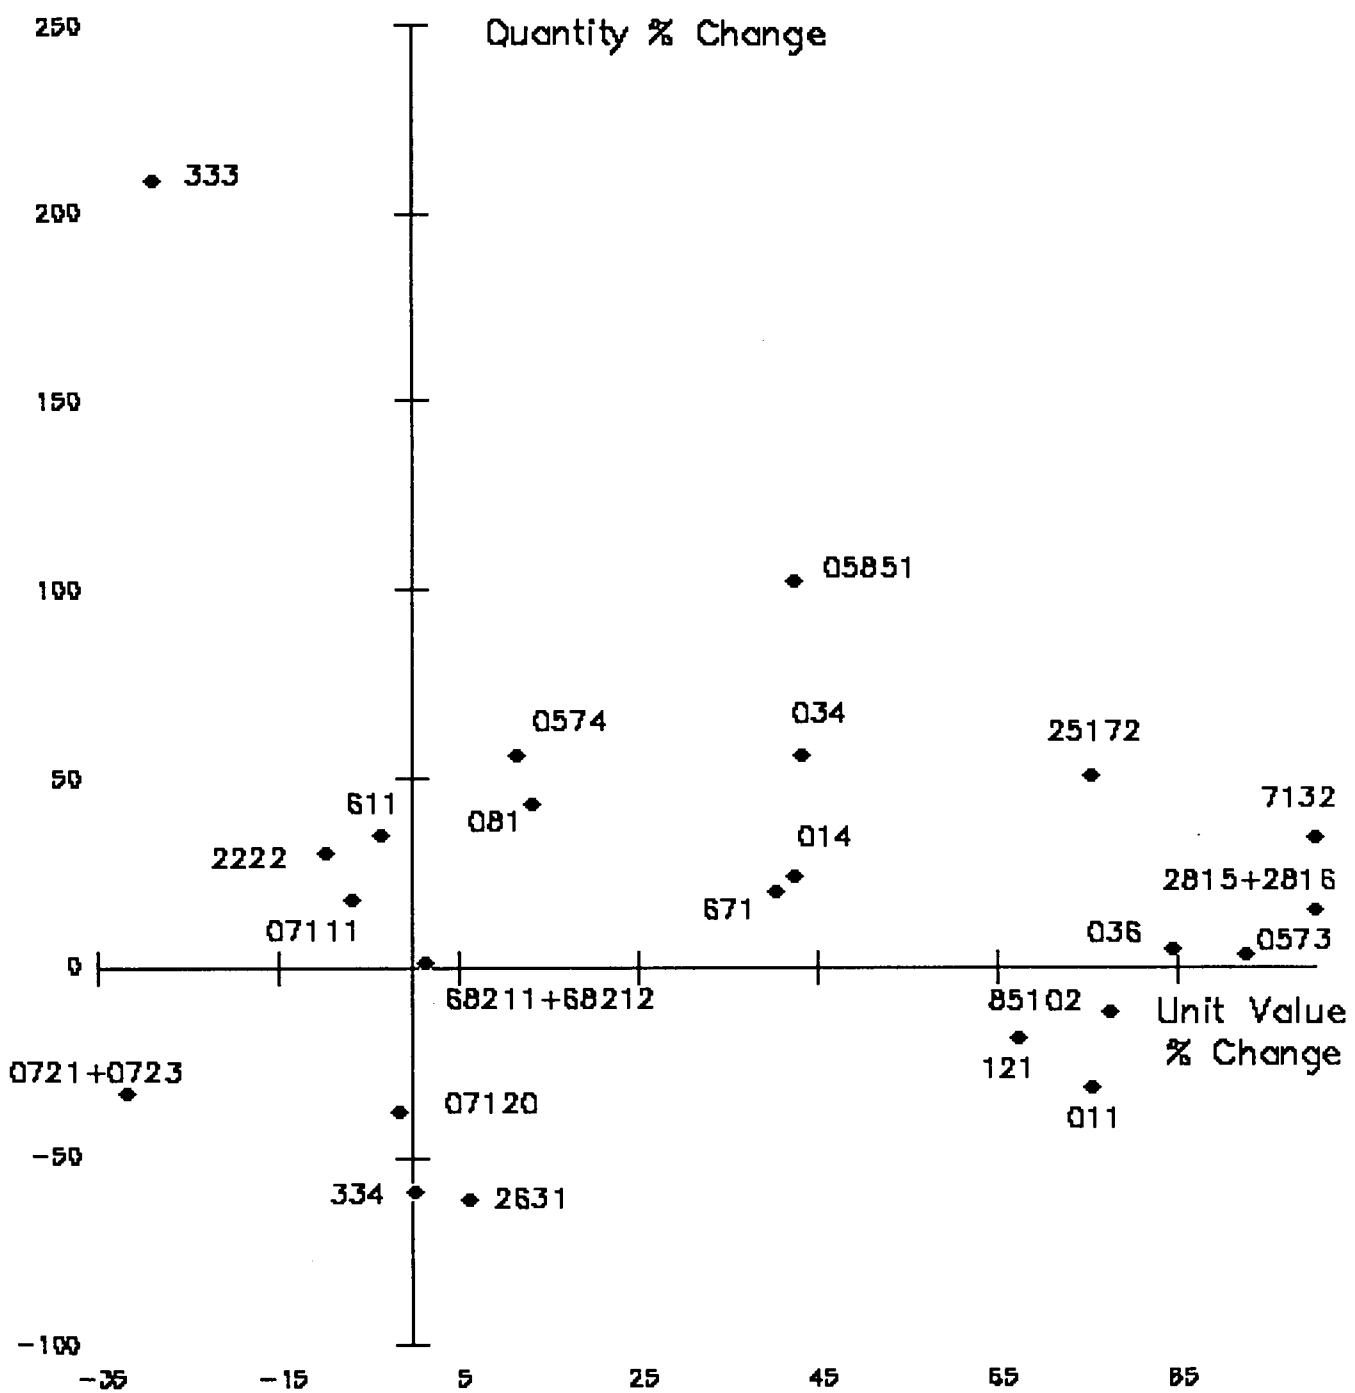

Thus, while leather footwear maintained its share of total EC imports from LA20 (around 0.7%) that of leather fell from 1.7% in 1979 to 1% in 1987.

## **VEHICLES**

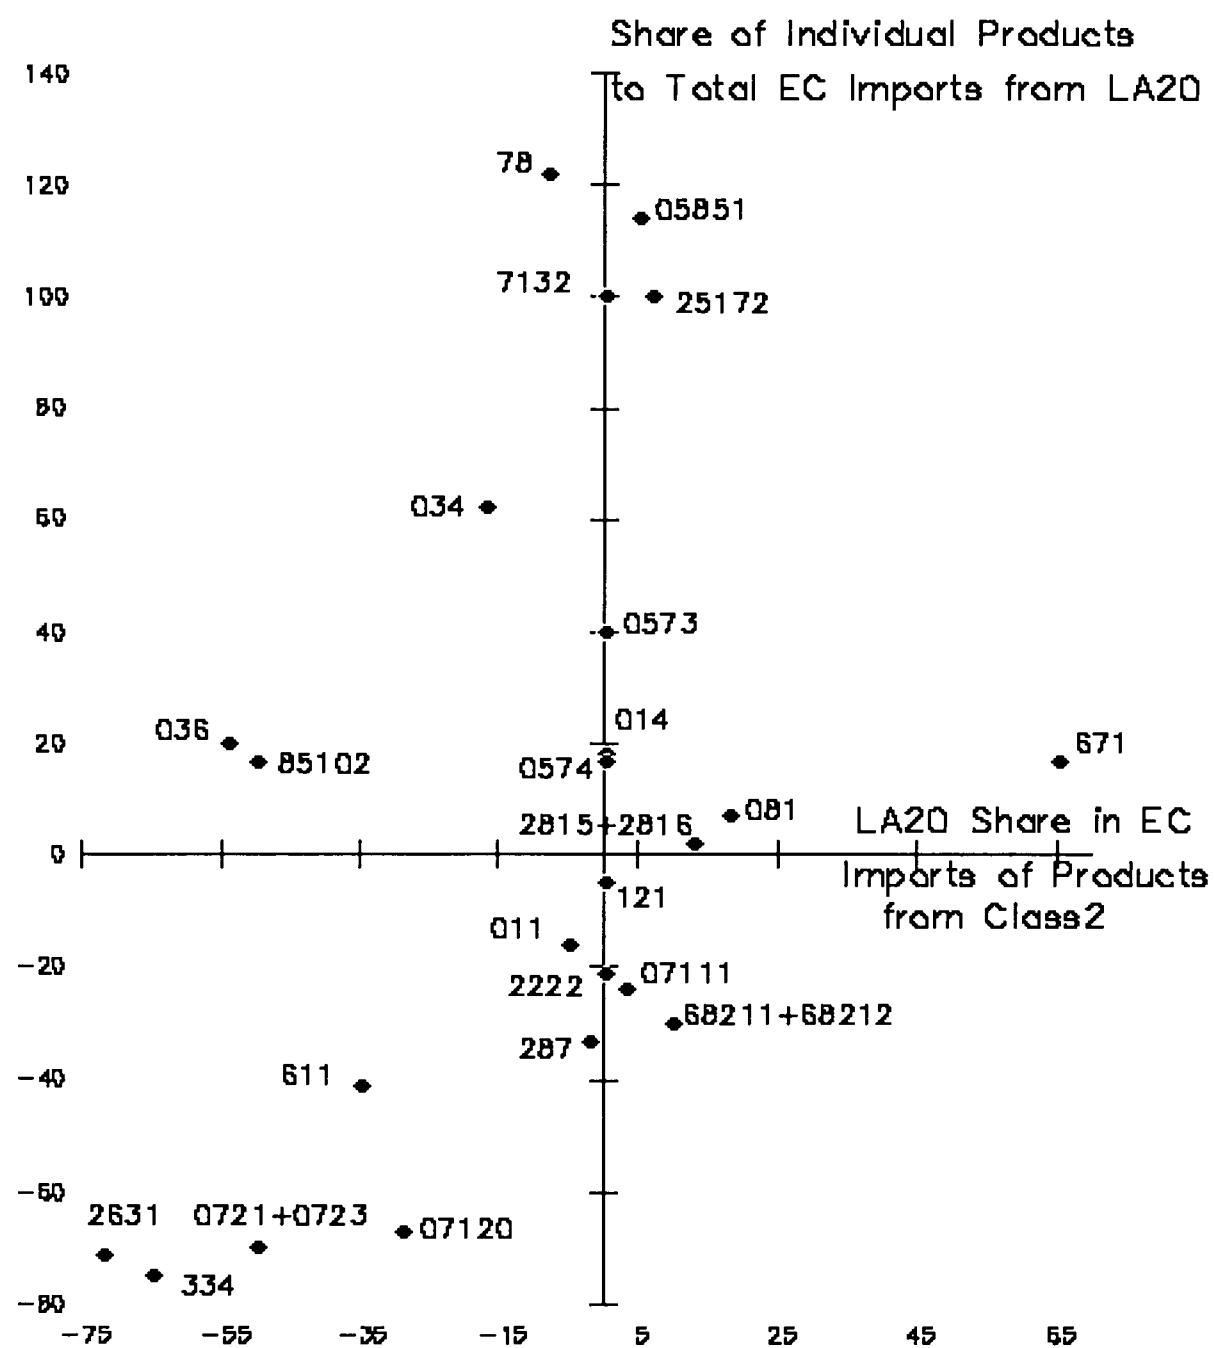

**Motor vehicle piston engines** (713.20) and **road vehicles** (78) are the emerging products in EC imports from LA20, both doubling their 1979 share in total EC imports from LA20, to 1% and 2% respectively. In fact, Latin America is the sole Class 2 EC supplier in the first product and the greatest in the second with about 60%.

The value of this trade increased by 168% in the first product and by 225% in the second. The quantity of engines supplied increased by about 50% from 1979 to 1987, while its unit value doubled.

**Illustration 3.1: EC Imports of Individual Products from LA20  
(Changes between 1979 and 1987)**

**Illustration 3.2: EC Imports of Individual Products  
(Changes between 1979 and 1987)**

### PART THREE TABLES (I)

TABLE 3.1: RANKING OF THE MOST IMPORTANT INDIVIDUAL PRODUCTS EXPORTED BY LA20 TO THE EC (1986)

RANK	SITC	NAME	VALUE (1000ECU)	% of TL	Cum % TL

## B. THE EC EXPORTS TO LATIN AMERICA

EC exports to Latin America are much more diversified in terms of products than its imports from there. Indeed, it is only the nine first products that their share exceeds 1% of total EC exports there. The thirty most important products only covering a third of the EC exports to Latin America, as opposed to over two thirds in the case of imports from there.

The EC export products that are going to be examined individually were chosen in the same way that the products imported were. Their trend over the 1979-1987 period, is again similar to the overall trend observed in Part One, although here they represent a much smaller share of total EC trade with Latin America.

In illustration 3.3 the relationship in changes between 1979 and 1987 in the unit values and the quantities exported in individual products is examined.

The greatest number of individual products exported by the EC to Latin America experienced an increase in their unit values from 1979 to 1987, with a corresponding decrease in the quantities imported.

Three products (textile and leather machinery, telecommunication equipment and motor vehicle parts) increased both their unit values and the quantities exported.

Three products' (iron simple steel coils, blooms etc., heating, cooling equipment and printed books and pamphlets) fall in unit values was matched by an increase in the quantities supplied.

### FOOD ITEMS

In 1986 the EC started exporting **bovine meat** (011.1) to LA20, which absorbed 17.5% of the EC exports of bovine meat. In 1987 this share was halved.

Some 14% of the EC exports of **dry milk** (022.42+022.43) go to LA20.

LA20 absorbed in 1987 13% of EC exports of **whisky** (112.41). In 1986 it was the ninth most important individual product exported by the EC Tto LA20.

### CHEMICALS

About 12% of the EC exports of **heterocyclic compounds other than lactams** (515.69) go to LA20. The value of these exports doubled from 1979 to 1987, as a result of a doubling in the unit value of this product.

LA20 absorbs 6% of the EC exports of **medicinal pharmaceutical products** (541). Although the value of this trade increased by 78% from 1979 to 1987 the share going to the LA20 market decreased by 25%.

### IRON

LA20 is a rather erratic market outlet for EC exports of **simple iron steel coils, blooms etc** (672.51+672.71). The value of this trade has doubled from 1979 to 1987 as a result of a doubling of the quantities exported there, accounting in 1987 for 10% of the EC exports as opposed to 8% in 1979. This share soared to 15% in 1981, only to shrink to 3% in 1985.

### MACHINERY

Machinery is an important aspect of EC exports to LA20, although the evolution of this trade in the 1979-1987 was one of mixed results.

The quantity of EC exports of **piston engine parts** (713.90) to LA20 were cut by about 40% from 1985 to 1986 and only an increase in their unit value moderated the fall in the value of the exports of this product.

While in 1979 LA20 absorbed 13% of EC imports of piston engine parts, this share was halved by 1987.

About 6% of 1987 EC exports of **wheeled tractors** (722.40) went to LA20. Although the unit value showed an increase, the quantity supplied fell sharply in 1987, restricting the value of these exports in 1987 at just below their 1979 level.

About 10% of the EC's exports of **textile and leather machinery** (724) in 1987 went to LA20, a share that was reduced by 50% from its 1979 level.

Although the unit value revealed some increases in the first half of the 1980's returned in 1987 to its 1979 level. An increase in the quantities exported on the other hand accounts for a 30% increase in this trade between 1979 and 1987.

Almost 10% of 1979 EC exports of **specialised industry machinery** (728.4) went to LA20. This share was reduced to 6.6% in 1987. At the same time unit value doubled and quantities exported shrank by 50%.

Although the value of EC exports of **heating and cooling equipment** (741) to LA20 only decreased marginally from 1979 to 1987, LA20's 1979 9% share of EC exports was reduced to 5.7% in 1987.

The unit value of EC exports of **non-electric machinery** (749) to LA20 doubled between 1979 and 1987, but the quantities exported decreased substantially, resulting in a 30% increase in the value of these exports between 1979 and 1987.

Although the quantity and the overall value of EC exports of **telecommunication equipment** (764) to LA20 doubled from 1979 to 1987, LA20 always absorbs some 10% of total EC exports of this product. In 1979, LA20 absorbed 8.6% of EC exports of **switchgear** (772.10). In 1987 this share was reduced to about 6% in 1987, although the actual value of these exports increased by 20% between 1979 and 1987.

## **TRANSPORT EQUIPMENT**

Although LA20's importance as an EC export market for **passenger motor vehicles** (781.0) was never significant (3.5% of EC exports in 1979) it has further declined in importance (1% of Ec exports in 1987).

Despite a virtual doubling in the unit value of these exports, the value of the EC exports in 1987 was only 83.6% its 1979 level, illustrating a cut by half in the quantities exported there.

By contrast, the value of EC exports of **motor vehicle parts** (784) doubled from 1979 to 1987, reflecting both an incresae in the quantities exported and their unit values. In fact, LA20 absorbed in 1987 9.2% of EC exports.

The EC **exports of ships and boats** (793.2) to LA20 suffered even greater reductions than the exports of passenger motor vehicles. While in 1979 LA20 absorbed a fifth of the EC exports, it was only absorbing a tenth in 1987. In fact, the value of these exports in 1987 were 63% their 1979 level. The bulk of this decline occured in 1986 and 1987.

## **MEASURING and CONTROLLING INSTRUMENTS**

Despite a 50% increase in the value of EC exports to LA20, caused by an increase in the unit value, the relative importance of LA20 as an export market for **measuring and controlling instruments** (874) was reduced from 7.4% of total EC exports in 1979 to 4.2% in 1987.

## **BOOKS and PAMPHLETS**

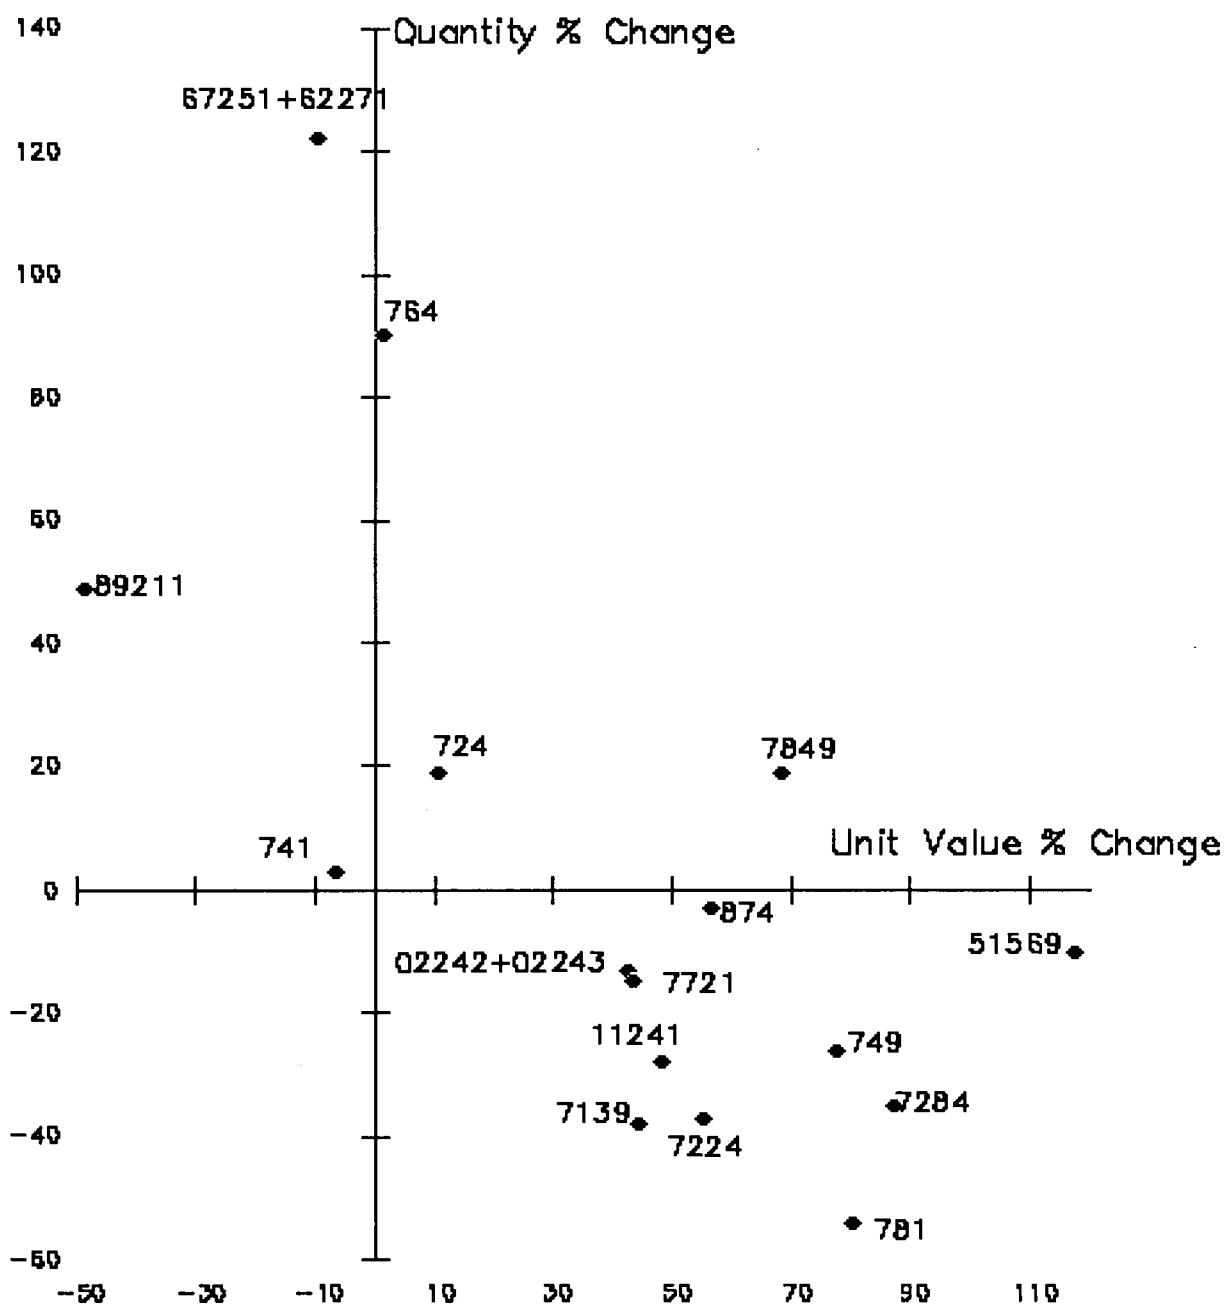

Although the quantities of **books and pamphlets** (892.11) exported increased, a drastic reduction in the unit value that occured in 1987, has limited the value of these exports in 1987 at 76.6% their 1987 level.

Moreover, while LA20 absorbed 18.5% of EC exports in 1979, it only absorbed 8% in 1987.

### PRECIOUS METAL JEWELLERY

Precious metal jewellery (897.31) is the fifth most important individual product exported by the EC to LA20 (1.3% of EC exports to LA20 in 1986). LA20 however, only accounts for 3% of total EC exports.

**Illustration 3.3: EC Exports of Individual Products to LA20  
(Changes between 1979 and 1987)**

## PART FOUR: TRADE BETWEEN THE EC AND INDIVIDUAL LATIN AMERICAN COUNTRIES

### A. THE RELATIVE IMPORTANCE OF INDIVIDUAL LATIN AMERICAN COUNTRIES IN THE EC-LATIN AMERICA TRADE

Latin American countries vary greatly between them both in terms of size and type of production. Accordingly, their relative importance in the EC-Latin American trade varies substantially (Table 4.1).

The three Latin American NICs (Argentina, Brazil and Mexico) are the ones with the greatest share in the EC-Latin America trade. Brazil is undisputedly the most important of all, accounting for about a third of the EC imports from Latin America and almost reaching a quarter of EC exports there in 1987. Argentina's 1979 position of relative importance decreased drastically from 1979 to 1985, its share of EC imports from LA20 halved. On the contrary, Mexico's position of relative importance increased dramatically, its share of EC imports from LA20 tripling.

The only other Latin American country to be of similar importance as an EC trade partner is Venezuela, which is an OPEC country. Its share of EC imports from LA20 rose to be higher than that of Argentina in 1985, only to be more than halved in 1987. Its share of EC exports to LA20 on the other hand, remained stable at about 15%.

Next to these four LDCs whose position of relative importance as EC trade partners fluctuated mostly above 10% of the EC-Latin American trade, two countries accounted for between 5% and 10% of the EC-Latin American trade: Chile and Colombia.

The rest of the Latin American countries are of rather modest importance as EC trade partners, at below 5% of the EC-Latin American trade. Among them, Cuba, Panama, Ecuador and Uruguay have had relatively greater trade involvement with the EC; most notably, the first two as EC export markets.

Differences among Latin American countries however, are not limited to their relative size as EC trade partners, but it extends to differences in the structure of their bilateral trade. This will be examined in comparative terms among partners of similar importance. Thus, in section B1 the discussion will focus on EC trade with its major Latin American partners, accounting for more than 10% of the EC-Latin America trade; namely, Brazil, Argentina, Mexico and Venezuela. In B2, the EC trade with Chile and Colombia (each representing between 5% and 10% of EC-Latin America trade) will be examined. Finally, in section B3 the discussion will turn to EC trade with smaller partners.

Before proceeding to this discussion however, one remark should be made about the product concentration of EC trade with individual Latin American countries. **At least half the EC imports from all individual Latin American LDCs, except Peru and the Dominican Republic, were concentrated in one broad product category** (food items for thirteen of them, agricultural raw materials for two, ores and metals for two others and fuels for Venezuela and Mexico). In 1979, it was only EC imports from Mexico that had not one product group accounting for over half of the total.

## **B. SECTORAL COMPOSITION OF EC TRADE WITH INDIVIDUAL LATIN AMERICAN COUNTRIES**

### **B1. EC TRADE WITH ITS MAJOR LATIN AMERICAN TRADE PARTNERS**

**About two thirds of the EC imports from Latin America come from Brazil, Argentina, Mexico and Venezuela (64% in 1979 and 69% in 1987), in 1985 reaching as high as 76%.**

**Brazil alone supplied over 2% of total EC imports in 1987 (A.1.4) and over 6% of EC imports from Class 2 (A.1.6). Half of the 1987 EC imports from Brazil were food items.** This represents almost 10% of the EC's total food items imports in 1987, reaching as high as 13.4% in 1985 (A.2.13). Half of this was coffee and oil seed cake. The second most important category is manufactures. It is worth noticing that the EC imports from Brazil all types of manufactures, including high technology products (reaching 5% of total EC imports from Brazil in 1987). In fact, two thirds of EC imports of manufactures from LA20 come from Brazil; representing 1% of total EC imports of manufactures (A.2.17). Another important product imported by the EC from Brazil is iron ore; Brazil supplying 5.5% of total EC imports of ores and metals. It should be underlined here, that between 1985 and 1987 exists a tendency of switching emphasis away from imports of food items and towards imports of manufactures.

**EC imports from Argentina** on the other hand are heavily concentrated on food items, which account for about 80% of total EC imports from this country and more than 4% of total EC imports of food items in 1987. The rising product is oil seed cake (accounting for a quarter of total EC imports in 1987). Manufactures are about 10% of the total, with most of the rest being agricultural raw materials.

**The product structure of EC imports from Mexico has been deeply affected by imports of fuels.** While in 1979 fuels accounted for just over a quarter of the EC imports from Mexico, its share soared to 86% in 1985, to settle at just over two thirds of the total in 1987 (Mexico supplied in 1987 3.5% of total EC imports of fuels, A.2.15). These changes obviously affected the relative importance of the rest of the products. Thus, while imports of food items and manufactures were just as important as imports of fuels in 1979, their importance was limited to 7% and 15% respectively in 1987. Imports of ores and metals decreased from 12% in 1979 to 7% of the total in 1987.

**Venezuela owes its importance as EC supplier almost exclusively to fuels.** Indeed, about 80% of the EC imports from Venezuela are fuels, with the percentage reaching 91% in 1985. In 1983 Venezuela supplied almost 3% of the EC's imports of fuels. By 1987 however, this share was almost halved (A.2.15) The only other notable product supplied to the EC is ores and metals, the greatest part being iron ore.

**Brazil, Argentina, Mexico and Venezuela also absorb about two thirds of the EC exports to Latin America (66% in 1979, 60% in 1985 and 65% in 1987).** In 1987 they absorbed 2.6% of total EC exports, a drastic reduction from 4.2% in 1979 (A.1.5). Manufactures account for the bulk of these exports (in the region of 80% of total EC exports). The rest is mostly exports of metals and to a lesser extent food items. Generally, almost half of the exports of manufactures is machinery. About 20% of total EC exports to these countries is high technology produce.

## **B2. EC TRADE WITH MIDDLE LATIN AMERICAN TRADE PARTNERS**

**Chile and Colombia supplied 16% in 1979, 11% in 1985 and 14% in 1987 of the EC imports from Latin America.** The product composition of EC imports from the two countries is very different. Half the EC imports from Chile in 1987 were **ores and metals**, the bulk of which is **copper** (accounting for over 43% of the total in 1987 and over half the total in 1979). In fact, Chile is the second most important Latin American supplier of ores and metals to the EC, accounting for 3.25% of the EC's total imports in this sector (A.2.16). Although this is still the most important category in EC imports from Chile its relative importance has been reduced significantly from 1979 when ores and metals accounted for two thirds of the EC imports. The sector that gradually gains in relative importance displacing imports of ores and metals, is imports of **food items**. From 15% of total EC imports in 1979, it more than doubled in 1987. The rest of EC imports from Chile is mostly agricultural raw materials.

Three quarters of the EC imports from **Colombia** is **coffee**. Other food items account for about 10% more. Colombia supplied in 1987 3% of the EC's imports of food items (A.2.13). The rest of EC imports from Colombia are shared by agricultural raw materials and fuels.

**Chile and Colombia absorbed 10% of EC exports to Latin America in 1979 and 12% in 1985 and 1987.**

About 85% of these exports are **manufactures**. 8% of EC exports to both countries in 1987 were **metals**. The rest of the EC exports are mostly **food items**, although the importance of this sector has fallen since 1979.

## **B3. EC TRADE WITH SMALLER LATIN AMERICAN TRADE PARTNERS**

**All the rest of the Latin American LDCs supply less than a fifth of EC imports from this region (20% in 1979, 13% in 1985 and 17% in 1987).**

From the majority of these countries the EC mostly imports **food items** (in Costa Rica 90% of total EC imports in 1987, 63% in Cuba, 87% in Ecuador, 91% in El Salvador, 85% in Guatemala, 79% in Haiti, 87% in Honduras, 93% in Nicaragua, 67% in Panama, 79% in Paraguay). Imports of **coffee** often account for the bulk of these, as in the cases of Guatemala, Haiti and Nicaragua and to a moderate level in the cases of Costa Rica, Honduras and Paraguay.

Another important sector of EC imports from these LDCs are **ores and metals** (80% of EC imports from Bolivia in 1987, 32% in the case of the Dominican Republic, 69% in the case of Peru, 45% in the case of Uruguay).

The EC also imports ores from Cuba (15% of its imports from there in 1987) and Honduras (14% of total imports in 1985 but only 4% of the total in 1987). The Dominican Republic on the other hand only supplies metals to the Community. **Copper** is an important product in EC imports from Peru.

Some of the smaller EC trade partners in Latin America have a relatively greater emphasis than the greater trade partners in supplying **agricultural raw materials** (18% of the EC's imports from Uruguay in 1987, 13% from Paraguay, 11% from Guatemala, 8% from Honduras, 7% from Costa Rica, 6% from Peru, 5% from El Salvador).

In the case of some of these countries **manufactures** represent a surprisingly high percentage of EC imports. The most notable case is Uruguay. Almost half the EC imports from there are manufactures, the bulk of it being textiles and clothing. Another interesting case is Panama, where more than a quarter of the EC imports from there in 1987 were manufactures. A large share of this were imports of transport equipment<sup>1</sup>. Another country where textiles and clothing are responsible for a rather high percentage of manufactures is Peru. Lastly, 19% of EC imports from Haiti in 1987 were manufactures, mostly textiles and clothing, chemicals and other manufactures.

The structure of EC imports from some of these countries experienced significant changes.

The share of imports of metals from Bolivia doubled from 1979 to 1985 only to be cut to a ninth in 1987. Imports of food items from the Dominican Republic were displaced by imports of metals from 1979 to 1985. Imports of coffee from Ecuador lost almost three quarters of their relative importance by 1985. Imports of food items from Guatemala displaced in 1987 imports of agricultural raw materials. A similar phenomenon took place with regards to EC imports from Honduras and Nicaragua. An increase in EC imports of food items from Panama from 1985 to 1987 was at the expense of imports of transport equipment. Coffee displaced agricultural raw materials from 1985 to 1987 in imports from Paraguay.

**About a quarter of EC exports to Latin America go to the smaller EC trade partners there (24% in 1979, 28% in 1985 and 23% in 1987).**

Again, the EC mostly exports **manufactures**. The share of manufactures in these exports however varies. In Costa Rica, Cuba, Ecuador, Guatemala, Nicaragua, Panama and Uruguay the share of manufactures in total EC exports is over 80%. In Bolivia, Paraguay, the Dominican Republic, El Salvador, Honduras and Peru it is between 80% and 70%, while in Haiti it fell as low as 53% of the total in 1987.

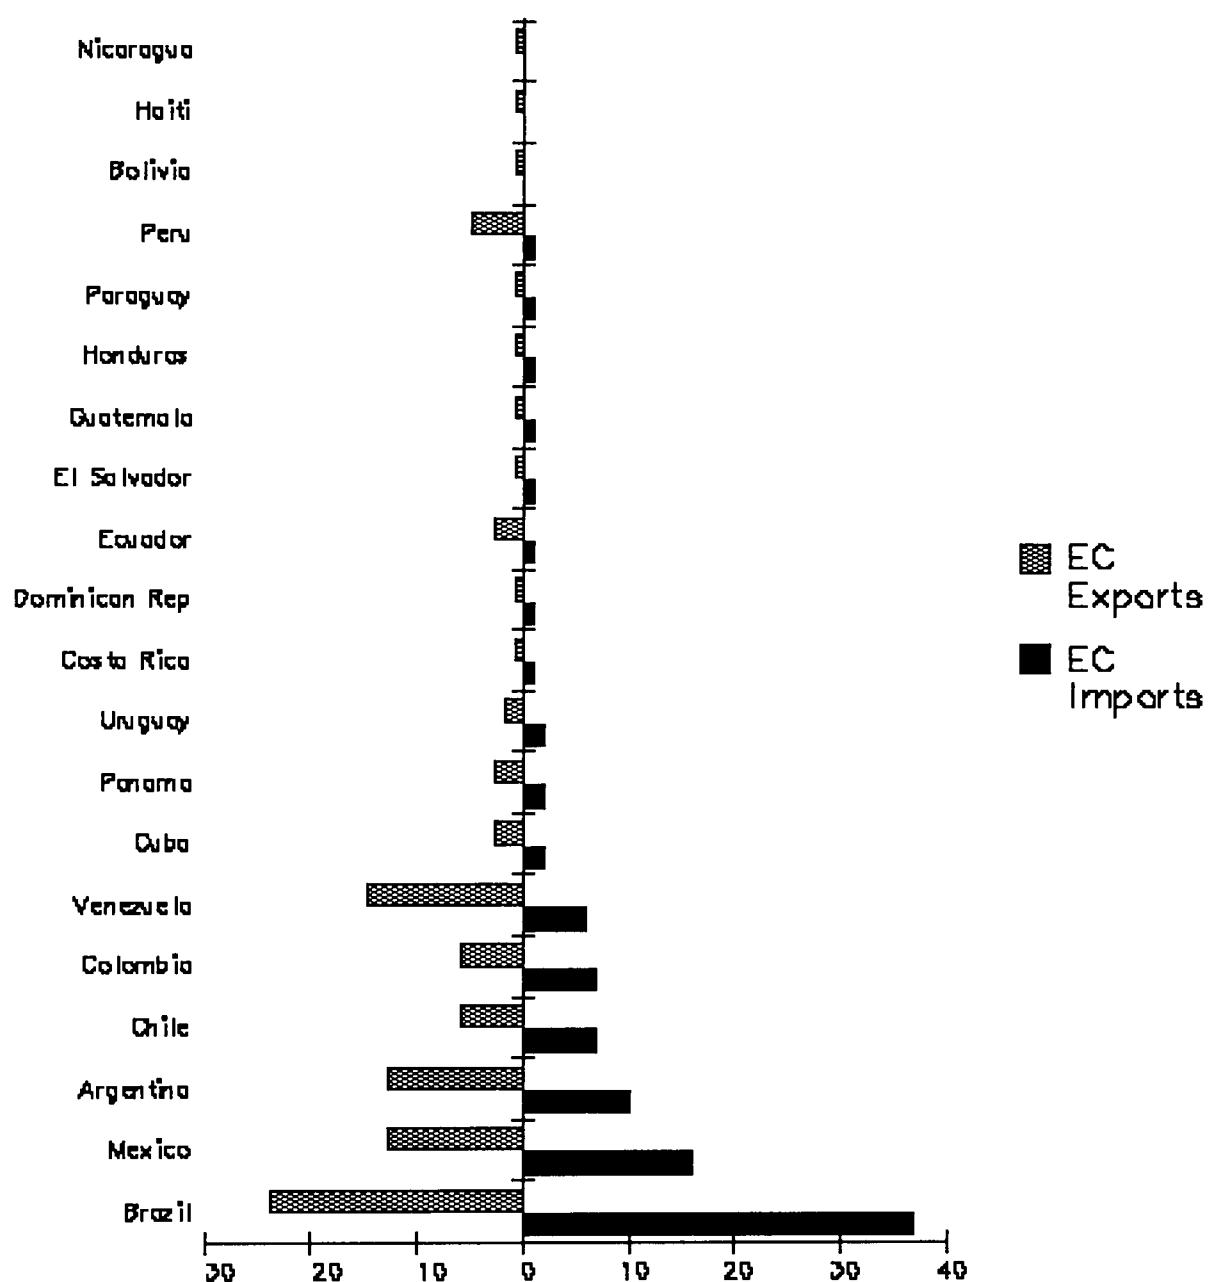

**Food items** accounted for over 10% of total EC exports to Bolivia, the Dominican Republic, El Salvador, Haiti (where in 1987 it reached 39%) Honduras, Nicaragua, Paraguay and Peru in 1987.

Exports of **metals** represented over 10% of total EC exports to Costa Rica, Cuba, the Dominican Republic, Ecuador in 1987, El Salvador, Guatemala and Haiti.

---

<sup>1</sup> This unusual phenomenon is due to the fact that ships under the Panamanian flag entering to the EC for repairs are considered as imports. This point is illustrated by the equally high percentage of EC exports of transport equipment to Panama, which accounts for the ships that depart from EC shipyards.

**Illustration 4.1: EC Trade (1987) with LA by Individual Partners (% Share)**

## METHODOLOGICAL ANNEX

### I. GEOGRAPHICAL CLASSIFICATION

#### A. EUROPEAN COMMUNITY (EUR-12)

It comprises of all EC Member-States as of January 1st 1986.

EC international trade comprise of all international commercial transactions excluding intra-EC trade. This trade will be henceforth referred to as trade with Extra-EUR12. For the rest of the countries, or groups of countries international trade will simply refer to the total of international commercial transactions with the "world".

#### B. LATIN AMERICA (LA20)

The following twenty Less Developed Countries (LDCs) are included in this geographical zone: Mexico, Guatemala, Honduras, El Salvador, Nicaragua, Costa Rica, Panama, Cuba, Haiti, Dominican Republic, Colombia, Venezuela, Ecuador, Peru, Brazil, Chile, Bolivia, Paraguay, Uruguay, Argentina. This group is divided into the following four regional sub-groupings:

**ALADI** (formerly LAFTA): Argentina, Bolivia, Brazil, Chile, Columbia, Ecuador, Mexico, Paraguay, Peru, Uruguay, Venezuela.

**CACM**: Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua

**Andean Pact**: Bolivia, Ecuador, Peru, Colombia, Venezuela.

**Latin American NICs (LA NICs)**: Argentina, Brazil, Mexico.

ALADI = Andean Pact + LA NICs + (Chile, Paraguay, Peru, Uruguay)

LA20 = ALADI + CACM + (Cuba, Dominican Republic, Haiti, Panama)

#### C. Class 1

**Class 1** includes all developed industrialised countries (DCs) except the EC. In this study when we refer to DCs we will include the EC and the following countries:

**USA + Japan + Other DCs** (Australia, Austria, Canada, Finland, Iceland, New Zealand, Norway, Sweden, Switzerland).

#### D. Class 2

**Class 2** = All developing countries (LDCs) + Yugoslavia

The following Class 2 regions will be examined separately:

**ACP 66**; which includes the African, Caribbean and Pacific LDCs that are signatories to the Lomé Convention.

**Mediterranean**; which includes all Mediterranean countries with which the EC has special agreements; namely: Morocco, Algeria, Tunisia, Egypt, Lebanon, Jordan, Syria, Cyprus, Yugoslavia, Israel.

**Asian LDCs:** Cyprus, Lebanon, Syria, Iran, Iraq, Israel, Jordan, Saudi Arabia, Kuwait, Bahrain, Qatar, United Arab Emirates, Oman, North Yemen, South Yemen, Afghanistan, Pakistan, India, Bangladesh, Maldives, Sri Lanka, Nepal, Bhutan, Burma, Thailand, Laos, Vietnam, Kampuchea (Cambodia), Indonesia, Malaysia, Brunei, Singapore, Philippines, Mongolia, China, North Korea, South Korea, Taiwan, Hong Kong, Macao.

## **II. PRODUCT CLASSIFICATION**

The classification used throughout this study is SITC, Revision 2.

The following broad product categories have been defined in terms of SITC Revision 2.

All food items: 0+1+22+4

Agricultural raw materials: 2-(22+27+28)

Fuels: 3

Ores and metals: 27+28+67+68

Manufactures: 5+6+7+8-(67+68)

Miscellaneous: 9

The share of some sub-sectors will also be treated separately. These are:

Coffee: 071

Iron ore: 281

Copper: 682

Oil seed cake: 0813

Textiles and clothing: 65+84

Machinery: 7-(78+79)

Transport equipment: 78+79

Chemicals: 5

Metals: 67+68+69 (it should be noted that SITC 69 is not included in the ores and metals defined above, as it includes a degree of industrial transformation)

High technology products (broadly based on the OECD definition):

524+

53110+5312+

### **III. INDICATORS**

#### **A. RATES OF GROWTH**

##### **A1. Average Rate of Growth (ARG)**

If  $X_1$  and  $X_t$  are the values at the first and last years respectively, of a time series with  $t$  number of yearly observations, then the average rate of growth will be defined as:

$$\text{ARG} = (X_t/X_1)^{1/t}-1*100$$

##### **A2. Relative Rate of Growth (RRG)**

In order to assess the growth of a bilateral trade relationship over a specific number of years in relation to the growth of the trade relationship of a comparable reporter to the same partner, both time series will be indexed to the same base year. This will also be called index of the size in question.

##### **A3. SECTORAL DECOMPOSITION**

The sectoral decomposition of a growth rate aims to provide information about the sectors that are responsible for the observed trends in the evolution of bilateral trade flows. The growth rate of a product basket is split according to the proper rate of each product component (growth rate of each product weighted by its share in the basket of products).

### **B. TRADE INTENSITY INDICATORS<sup>1</sup>**

Trade intensity indicators provide information about the relative strength of an economy as an exporter in particular export markets, sectors or their combination.

The strength of the exporters under examination is measured by the size of their market share. This convention is based on the assumption that the actual market share that an economy commands in any foreign market directly illustrates its competitiveness in that particular market relatively to that of its competitors. Consequently, specialisation indicators and indicators of revealed comparative advantage are used in various studies as substitutes.

---

<sup>1</sup> Adopted according to the definitions given by J. Roemer (1977) "The Effect of Sphere of Influence and Economic Distance on the Commodity Composition of Trade in Manufactures" The Review of Economics and Statistics pp.318-327.

Trade intensity indicators are in effect the same as specialisation and revealed comparative advantage indicators. The main difference to specialisation indicators is that trade intensity indicators view the relationship from the viewpoint of the exporter. Thus instead of viewing the reporter economy either as an importer or as an exporter depending on whether it is an import or export specialisation index, they always consider the exporter as the reporter and the importer as the partner economy.

Trade intensity indicators involve a three dimensional array of trade flows -trade by exporters to importers by sector- although when it concerns total export intensity or all sector trade, the importer or the sector dimension respectively, becomes redundant.

If the following notations are adopted:

$X_{AB}$	Exports from reporter A to partner B
$X_{WB}$	Exports from the world to B; or total imports of B
$X_{WA}$	Exports from the world to A; or total imports of A
$X_{AW}$	Exports from A to the world
$X_W$	Total world trade
$X^h_{AB}$	Exports from reporter A to partner B of product (or product sector) h
$X^h_{WB}$	Exports from the world to B of product (or product sector) h
$X^h_{WA}$	Exports from the world to A of product (or product sector) h
$X^h_W$	World trade of product (or product sector) h
$M^h_{AB}$	A's imports from B of product (or product sector) h
$M^h_{AW}$	A's imports of product (or product sector) h
$M_{AB}$	A's imports from B
$M_{AW}$	A's total imports

Then four indicators of trade intensity and one of specialisation may be defined.

### **B1. Area Intensity of Trade**

An economy's A area intensity of trade in a particular foreign economy B ( $\alpha_{AB}$ ) measures the strength of A as an exporter to B in relation to A's strength in the world market.

$$\alpha_{AB} = \{X_{AB}/X_{WB}\}/\{X_{AW}/(X_W-X_{WA})\}$$

If  $\alpha_{AB}=1$  then A has exactly the same strength in the market of B as its overall strength at the international level.

If  $\alpha_{AB}>1$  then A commands a more prominent position in B's market than its overall international position.

Conversely, if  $\alpha_{AB}<1$  then A's position in market B is weaker than its overall international position.

### **B2. Sector Intensity of Trade**

Economy A's sector intensity of trade in product h ( $\sigma_A^h$ ) measures the extent of economy A's strength in the international market of product h compared to its overall position in the international market.

$$\sigma_A^h = \{X_{AW}^h/(X_W^h-X_{WA}^h)\}/\{X_{AW}/(X_W-X_{WA})\}$$

If  $\sigma_A^h = 1$  then A is just as strong an exporter of product h as its overall strength as an exporter in the world market.

If  $\sigma_A^h > 1$  then A specialises in the export of product h.

If  $\sigma_A^h < 1$  then A is weaker in the export of product h compared to its overall strength in the world market.

### **B3. Area Intensity of Trade in Particular Sector**

Economy A's B-area intensity of trade in sector h ( $\alpha_{AB}^h$ ) measures the extent to which A controls the market of sector h in economy B, compared to its position in the world market of sector h.

$$\alpha_{AB}^h = \{X_{AB}^h/X_{WB}^h\}/\{X_{AW}^h/(X_W^h \cdot X_{WA}^h)\}$$

If  $\alpha_{AB}^h = 1$  then A is just as strong an exporter of product h to market B as its overall strength as exporter of product h.

If  $\alpha_{AB}^h > 1$  then A has a special emphasis in exporting product h to area B compared to its overall export structure.

If  $\alpha_{AB}^h < 1$  A tends to export less of product h to market B than its overall export strength in this sector.

### **B4. Sector Intensity of Trade in Particular Area**

Economy A's h-sector intensity of trade in area B ( $\sigma_{AB}^h$ ) measures the extent to which A specialises in product h in its exports to economy B. In order to assess the degree of this specialisation, the strength of A's exporting of h to market B is compared to the overall strength of A as an exporter to B.

$$\sigma_{AB}^h = (X_{AB}^h/X_{WB}^h)/(X_{AB}^h/X_{WB}^h)$$

If  $\sigma_{AB}^h = 1$  then A is as strong an exporter of product h to market B as its overall strength as an exporter to that market.

If  $\sigma_{AB}^h > 1$  then A tends to specialise more in exporting product h to market B.

If  $\sigma_{AB}^h < 1$  then A is a weaker exporter of product h in market B than its overall strength as an exporter to that market.

The sector intensity of trade in a particular area can in fact be also used in order to assess the intensity of an economy's sourcing in a particular sector or product from a given importer, if instead of export, import data are used. In this case it is a specialisation indicator that measures the extent to which economy A tends to specialise in product h in its imports from B. In order to assess that, one has to compare the share of B in A's imports of h, to B's overall share in A's imports. In this case one could consider the indicator to be defined as:

$$S_{AB}^h = (M_{AB}^h/M_{AW}^h)/(M_{AB}^h/M_{AW}^h)$$

If  $S_{AB}^h = 1$  then A imports as much of sector h from B as in the total of products.

If  $S_{AB}^h > 1$  then A tends to specialise in imports of h from B.

If  $S_{AB}^h < 1$  then A tends to import less of h than its overall imports from B.

### **C. CONCENTRATION INDICATORS**

Concentration indicators illustrate the degree to which the reporter's exports are biased in favour of concentrating either in terms of geographical direction or product structure.

#### **C1. Area Balance of Trade in Sector h**

Economy A's area balance of trade in sector h ( $m^h_A$ ) measures how even A's strength is in sector h across different areas.

$$m^h_A = B^{-1} \sum_{b=1}^B |1 - \frac{h_{AB}}{h_A}|$$

If  $m^h_A = 0$  then A commands the same share of the imports of product h in all the areas examined as its share in the world market. The more it deviates from zero, the more A's exports of product h are unequally concentrated across export markets.

#### **C2. Sector Balance of Trade in Area B**

Economy A's sector balance of trade in area B ( $\mu_{AB}$ ) measures how evenly strong A's trade in area B is across sectors.

$$\mu_{AB} = H^{-1} \sum_{h=1}^H |1 - \frac{h_{AB}}{h_A}|$$

If  $\mu_{AB} = 0$  then A does not specialise in any sector in the market of B. The more it deviates from zero, the more unequal the product concentration of A's exports to market B is.

### **D. BILATERAL BALANCE OF TRADE INDICATORS**

Bilateral balance of trade indicators show which of the two trade partners in a bilateral trade relationship is a net exporter.

#### **D1. Balance of Trade (BT)**

The balance of trade of any reporter country with a particular trade partner is defined as the difference between its exports to and the imports from that trade partner. A positive trade balance reveals how much more is the value of its exports from the value of its imports. Accordingly, a negative trade balance shows how much more the reporter imports rather than exports to the particular trade partner.

#### **D2. Import Cover Ratio (ICR)**

The import cover ratio is another indicator of the trade balance in a bilateral trade relationship. It is defined as the ratio of exports of the reporter to the partner under consideration over its imports from the same partner.

If  $ICR > 1$  then this reflects a positive trade balance for the reporter country with the particular partner. An increase in the ICR illustrates a strengthening of the reporter's position vis-a-vis its trade partner.

Conversely, if  $ICR < 1$  then this reflects a negative trade balance.

The ICR may also be expressed in terms of percentage, whereby it is equal to exports over imports times one hundred. The difference of the ICR to the balance of trade indicator is that whilst the latter deals in terms of absolute numbers with the balance of the bilateral trade, the former illustrates it in relative terms. Thus, the advantage of the ICR is that it enables the comparison of the reporter's trade relationship with any specific partner, to that of any comparable reporter with the same partner and that of the same reporter with a different partner.

#### **IV. DATA**

##### **A. DATA SOURCE**

COMTRADE, UNSO Data Base, Geneva.

##### **B. CURRENCY**

The currency used throughout the analysis is ECU. COMTRADE data are compiled in US dollars. Our values are derived in ECU in current prices.

It should thus be borne in mind that part of the trade effects observed in this study may be a purely monetary phenomenon reflecting changes in the value of ECU with respect to the US dollar.

In order to provide an indication of the magnitude of the monetary bias in the observed effects, the ECU-US dollar parity for the 1979-1987 period is given here:

<u>Exchange rate US dollar-ECU (1979-1987)</u>									
1979	1980	1981	1982	1983	1984	1985	1986	1987	
1 US\$=ECU	0.729581	0.718221	0.895696	1.020710	1.123318	1.267379	1.310461	1.016601	0.866220

##### **C. REPORTERS**

In the data used in this study, mainly market economy countries have been reporters. Consequently, it should be borne in mind that when trade intensity indicators were calculated for partner countries, import data have been used as export data. Although this practise will inevitably introduce an amount of inaccuracy in the resulting figures it was thought that it will not affect the conclusions of the analysis as these are going to be discussed mostly in relative terms.

##### **D. DEFINITION OF THE "WORLD" IN COMTRADE DATA**

The COMTRADE database definition of total world trade understates the real value to the extend that it does not include in the aggregate the value of trade between countries that are not reporters. Such countries are usually smaller LDCs and most Class 3 countries. The number of countries that fail to report their external trade to COMTRADE is not fixed. Accordingly, the extend to which total world trade as it appears in COMTRADE is understated can not practically be determined.

As a consequence of this inaccuracy, a part of the trade intensity indicators derived in this study are not accurate. However, the extent of their inaccuracy is not such as to preclude their use, especially when the evidence they provide is discussed in relative terms.
