Las publicaciones de Eurostat están clasificadas por temas y por series. La clasificación se encuentra al final de la obra. Para mayor información sobre las publicaciones, rogamos se pongan en contacto con Eurostat. Para los pedidos, diríjanse a las oficinas de venta cuyas direcciones figuran en la página interior de la contracubierta.

Eurostats publikationer er klassificeret efter emne og serie. En oversigt herover findes bag i hæftet. Yderligere oplysninger om publikationerne kan fås ved henvendelse til Eurostat.
Bestilling kan afgives til de salgsstæder, der er anført på omslagets side 3.

Die Veröffentlichungen von Eurostat sind nach Themenkreisen und Reihen gegliedert. Die Gliederung ist hinten in jedem Band aufgeführt. Genauere Auskünfte über die Veröffentlichungen erteilt Eurostat.
Ihre Bestellungen richten Sie bitte an die Verkaufsbüros, deren Anschriften jeweils auf der dritten Umschlagseite der Veröffentlichungen zu finden sind.

Οι εκδόσεις της Eurostat ταξινομούνται κατά θέμα και κατά σειρά. Η ακριβής ταξινόμηση αναφέρεται στο τέλος κάθε έκδοσης. Για λεπτομερέστερες πληροφορίες σχετικά με τις εκδόσεις, μπορείτε να απευθύνεσθε στην Eurostat.

Για τις παραγγελίες μπορείτε να απευθύνεσθε στα γραφεία πώλησης, των οποίων οι διευθύνσεις αναγράφονται στη σελίδα 3 του εξωφύλλου.

Eurostat's publications are classified according to themes and series. This classification is indicated at the end of the publication. For more detailed information on publications, contact Eurostat.
Orders are obtainable from the sales offices mentioned on the inside back cover.

Les publications d'Eurostat sont classées par thème et par série. Cette classification est précisée à la fin de l'ouvrage. Pour des informations plus détaillées sur les publications, contactez Eurostat.
Pour les commandes, adressez-vous aux bureaux de vente dont les adresses sont indiquées à la page 3 de la couverture.

Le pubblicazioni dell'Eurostat sono classificate per tema e per serie. Tale classificazione è precisata alla fine dell'opera. Per informazioni più dettagliate sulle pubblicazioni rivolgersi all'Eurostat.
Per eventuali ordinazioni rivolgersi a uno degli uffici di vendita i cui indirizzi figurano nella 3^a pagina della copertina.

De publikaties van Eurostat zijn ingedeeld naar onderwerp en serie. Deze indeling is achter in het boek opgenomen. Voor nadere informatie over de publikaties kunt u zich wenden tot Eurostat.
Gelieve bestellingen op te geven bij de verkoopbureaus, waarvan de adressen op bladzijde 3 van de omslag zijn vermeld.

REPORTS ON THE DEMOGRAPHIC SITUATION OF THE COUNTRIES		225
--	--	-----

Introduction

The "Demographic Statistics 1994" yearbook presents the most important population data on each topic for the Community and the Member States, allowing a direct country-to-country comparison to be made for each phenomenon or indicator. There are numerous graphs to illustrate the figures, the most recent of which are for 1992. A short description of demographic situation of each country in 1992 can be found at the end of this volume.

All tables of the 1994 edition are based on the territorial status of the Federal Republic of Germany as from 3rd October 1990. The summations and estimations for the Community have consequently been revised.

A special chapter has been included for the European Economic Area. It presents data for the countries of the European Free Trade Association.

The statistics on civil status (births, deaths, marriages, etc.) contained in this volume pertain to events which actually occurred during the year in question and not to those which were recorded during the year. The reference is to the date on which event took place.

The population statistics and those on civil status cover both nationals and foreigners normally resident in the

territory. Events which concern nationals but occur outside a country's territory are not included in the national statistics.

In order to ensure comparability between the Community countries, Eurostat uses a software system called SYSCODEM. This system, which the Institut National d'Etudes démographiques in Paris kindly made available to Eurostat, makes it possible to calculate different demographic indicators using a common method.

The tables for the Community and the countries of the European Free Trade Association. Countries have been based on figures provided directly by the national statistical services, whilst the data for non-Community countries have been taken from national or international publications. Figures have not generally been rounded except where it has been national practice to do or where estimates relate to the Community as a whole.

Eurostat would like to thank the national statistical services for their active and effective cooperation which has helped to make this project a success.

Luxembourg, April 1994

THE POPULATION OF THE EUROPEAN COMMUNITY

The population of the European Union as at 1 January 1993 was 347.3 million, 1.6 million more than on the same date the year before. At 0.4%, the annual growth rate has been more or less constant since 1990.

Net migration main factor behind growth

The reasons for the growth in the EU population were similar to those in previous years: net migration accounted for 2/3 of the total increase, whereas natural increase (0.5 million: 3.95 million births less 3.45 million deaths) was the lowest since 1960. The decline in the natural increase was due entirely to a big fall in the number of births, since there were also slightly fewer deaths in 1992 than in the three previous years.

81 persons over the age of sixty to every 100 under the age of twenty

As at 1 January 1992, 24.7% of the EU population were under twenty, and 20.1% were over sixty. 3.5% of the population were over eighty, more than 2/3 of them women.

The ratio of over-sixties to under-twenties (the "ageing index") was 0.81 in 1992 compared with 0.63 in 1980.

Fewer than 4 million births in 1992

The number of births in the European Union fell below 4 million for the first time since 1960. There were 56 500 fewer births in 1992 than in 1991, although this figure should be increased by 11 000 (the approximate average number of births in one day) to allow for the fact that 1992 was a leap year.

As the number of women of child-bearing age remained stable, the trends in birth rate and fertility ran parallel. The fertility indicator continued the decline which began

in 1990, reaching a post-war low of 1.48 children per woman. The main cause was the continuing fall which has been recorded in Germany since unification (Germany accounts for 20% of all births in the EU) and declines in southern Member States (Greece, Spain, Italy).

Fertility rates among women in the 20-25 age group continued to fall. Although there was some increase in fertility among women over thirty, it was not sufficient to offset declining fertility among younger women.

Although overall fertility is decreasing, more children are being born outside of marriage. One-fifth of all children born in the EU in 1992 were conceived out of wedlock, compared with one-tenth in 1980.

Marriage rate still low

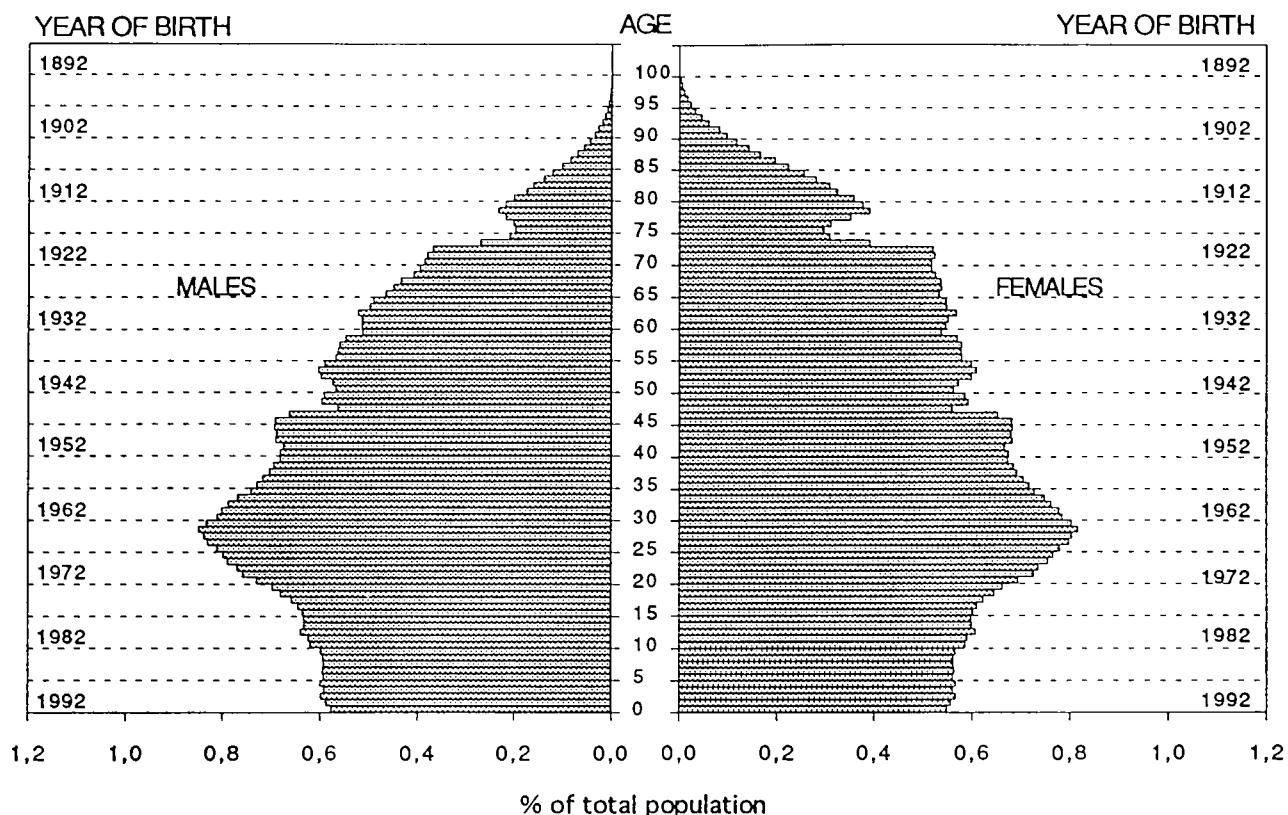

1 884 900 marriages took place in the EU in 1992, 73 700 fewer than in 1991. The gross marriage rate in 1992 was 5.40/00. The number of divorces fell by 1% between 1990 and 1991.

Life expectancy continues to increase

3 452 400 people died in the EU in 1992. Given that the population is ageing, this 1.4% decline on the figure for 1991 means that life expectancy at birth is increasing.

In 1991, life expectancy at birth was 72.9 years for men and 79.5 years for women. The 6.6-year difference between the sexes was the same as the previous year. The difference is greatest in the 20-25 age group, in which men are 3 1/2 times more likely to die than women.

The infant mortality rate continued to fall. In 1992, 7 out of every 1 000 children died before reaching the age of one. The decline in infant mortality over the last decade is due mainly to successes in reducing the number of deaths among children in their first week (the time at which about half of all deaths among children under the age of one year occur).

EXPLANATORY NOTES

GENERAL

The registration statistics published in this Yearbook are supplied by the national civil registration systems, which are the responsibility of the Ministry of the Interior and/or the Ministry of Justice except in Ireland and the United Kingdom where they come under the Office of the Registrar General (a self-contained department).

In some cases, statistics on marriage and divorce are taken from sources other than registers of births, marriages and deaths. In several Community countries, data on marriages are taken from the records of Church ceremonies, and those on divorce from records of Court proceedings. In most countries, the Ministry of Justice centralizes the information and sends it to the National Statistical Institute. There is no divorce in Ireland.

Seven Community countries have municipal population registers (table 1), the general principle of which is an exhaustive and continually updated record of the population. In most cases, the administration of each basic territorial unit is responsible for running the population register (births, deaths, changes of residence, etc.).

The data published are not fully standardized, owing to the lack of uniform definitions for the events registered, or to the way in which the events referred to are recorded or the registration records are processed, as is the case with birth orders, or to the classification by age, which may differ from one country to another or from one category of events to another.

Definitions of demographic events differ somewhat from country to country. Although the discrepancies are generally negligible, in the case of foetal deaths they are quite appreciable (table 4).

Classification of events by age of subject during a given year may be based on one of two definitions of age:

-*the age reached during the calendar year under consideration*, i.e. the difference between the year of observation and the year of birth;

-*the age in completed years at the time the event occurs*, i.e. the age at last birthday.

A cursory comparison of the rates produced using one or other of these definitions may distort both the picture they give of reality and international comparisons. Taking one or other of these definitions produces significant

Table 1: Comparison of types of population register by Member States

Computerized and centralized	Municipal register ⁽¹⁾	Register of foreigners	No register
Belgium (Registre National)	Belgium	Germany ⁽²⁾ (Ausländerzentral-register)	Greece (3)
Denmark (Central population register)	Denmark		France
Luxembourg (Répertoire général des personnes physiques)	Germany (melderegister)		Ireland
	Spain (Padrón)		Portugal
	Italy (Anagrafe)		United Kingdom
	Luxembourg		
	Netherlands (Persoonregister)		

(1) Partially computerized in Germany, Luxembourg, Spain and Italy; fully computerized in the Netherlands.

(2) Computerized and centralized register

(3) Registers are kept at municipal level for Greek nationals only

differences, particularly in analyses by year of age, since the actual ages to which rates in completed years refer are on average six months lower than those to which rates by age reached during the calendar year refer.

In order to solve this problem Eurostat used SYSCOEM to introduce a conversion method in 1991 which provides comparable data on fertility and first marriages for all Community countries regardless of the definition used.

CHAPTER A AND B: POPULATION CHANGE AND POPULATION STRUCTURE

Annual population estimates are based either on the most recent census, which in this case means those conducted during the 1980's wave (results from the 1990-91 wave are not yet available), or on the population register.

Four different types of evaluation method are used to estimate the total population, and updating is based on several reference dates (Table 2).

Traditionally, Ireland estimates its population each year in 15 April, the United Kingdom on 30 June and Greece on 1 July. These estimates give the mean population. The other Member States carry out their main estimates on 1 January, calculating the average population as the arithmetic mean of the population on 1 January for two consecutive years (Table 2).

Exceptions to this are:

- the Federal Republic of Germany, which works out the arithmetic mean of monthly total population estimates;
- Denmark and the Netherlands, which refer to the status of their register on 1 July;

The estimation method also varies according to the observation method. Belgium, Denmark and the Netherlands take the status of their population registers on a given date. Germany, Luxembourg and Italy use their population registers to obtain the net external migration figure which, when added to the natural balance, gives the population increase.

Greece, Portugal, France and the United Kingdom estimate the migration balance either by comparing various sources (Greece, Portugal, France), or by conducting a

specific survey at points of entry into the country (International Passenger Survey).

Ireland uses several indicators to provide a global estimate of its population and calculates net migration by the natural movement method.

Finally, Spain uses the results of each "Padrón" (five-yearly census of the population and main demographic characteristics) to extrapolate an annual figure. Mortality assumptions are taken from a mortality table centred on the year of the Padrón and hold constant over the period. Estimates are revised every five years when the next Padrón takes place.

It is in the field of migration that the definitions used by Member States differ most. For example, the minimum period for an "absence" to be considered as "migration" varies between three months (Belgium, Denmark, Spain, Italy and Luxembourg) and a year (United Kingdom), sometimes with no additional specification (Germany, Greece, France and Portugal). Furthermore, some countries use a subjective criterion such as the intention to remain for a certain period of time, regardless of whether this is actually the case (the Netherlands, United Kingdom).

The quality of the statistics produced by individual countries also varies greatly. It depends partly on the administrative system operating in each country and its methods (table 3).

CHAPTER C: THE EUROPEAN COMMUNITY AND ITS REGIONS

Demographic statistics at NUTS II regional level refer to 1991, the last available year.

The sum of the figures for total population, births and deaths may differ slightly from national data owing to the inclusion of data for which the regional breakdown is unknown.

Because different calculation methods are used to estimate national and regional migration balances, the sum of regional balances may differ slightly from the estimated national total.

The balances published at national level are those supplied by Member States and are calculated using the methods described under "Population change" above. By contrast, the regional balances for a particular year are estimated by Eurostat as being the difference between the total and natural growth in regional population over the same year.

Tableau 2: Annual population estimate in Member States

Country	Date of main estimate	Base	Evaluation method	Post-census re-evaluation	Mid-year population
B	1 January	1991 Census	Population Register	No	Arithmetic mean on 1 January for two consecutive years
DK	1 January	N/A	Population Register	N/A	Population register on 1 July
D	31 December	1987 Census	Component method	yes	Arithmetic mean of monthly total population estimates
GR	1 January	1991 Census	Component method	yes	Arithmetic mean on 1 January for two consecutive years
E	1 January	1991 Census	Projections based on results Padrón	yes	Arithmetic mean on 1 January for two consecutive years
F	1 January	1990 Census	Component method	yes	Arithmetic mean on 1 January for two consecutive years
IRL	15 April	1986 Census	Global estimate based on trends of 9 indicators	yes	15 April estimate
I	1 January	1991 Census	Component method	yes	Arithmetic mean on 1 January for two consecutive years
L	31 December	1991 Census	Component method	yes	Arithmetic mean on 1 January for two consecutive years
NL	1 January	N/A	Population Register	N/A	Population register on 1 July
P	1 January	1991 Census	Component method	yes	Arithmetic mean on 1 January for two consecutive years
UK	30 June	1991 Census	Component method	yes	30 June estimate

CHAPTER D: THE EUROPEAN COMMUNITY IN THE WORLD

Figures for non-Community countries generally come from international organizations, mainly the United Nations. Readers are asked to bear in mind that different countries use different statistical systems.

The comparability and reliability of data cannot always be guaranteed even if they have been compiled under the same conditions.

CHAPTER E: FERTILITY

Fertility rates by age and average age at birth of first child have been recalculated according to a single definition, namely the age reached in the year the event took place, which allows rates to be recombined by generation.

The method for converting rates by age in completed years into rates by age reached in the calendar year is described in G. Calot's "*La mesure des taux en démographie - âge en années révolues ou âge atteint dans l'année civile. Incidence du choix de la définition. Application à la fécondité générale (France, 1946-1981) [Measurement of rates in demographic studies - age in completed years or age reached during the calendar year. Impact of the choice of definition. Application to general fertility (France, 1946-1981)]*", INED, Travaux et Documents No 104, 1984.

The definition of births by parity differs substantially from country to country. Data on births by parity have not therefore been grouped together in a single table, nor has it been possible to compile a EUR 12 total. For Denmark, Greece, Spain, Ireland, Italy, the Netherlands and Portugal, the published birth parity covers a woman's reproductive years. For Belgium, the Federal Republic of Germany, France, Luxembourg and the United Kingdom the published birth parity is for the

current marriage. However, some countries have both types of information: France (not currently used), Italy, the Netherlands and Portugal.

Data on abortions depend on the legislative background against which they are carried out. Figures are not therefore fully comparable.

CHAPTER F: MARRIAGE AND DIVORCE

First marriages by age are published in completed years for two countries (Ireland and the United Kingdom), and by the age reached in the calendar year for all others. First marriage rates by age have been recalculated by Eurostat according to a single definition, namely the age reached in the year the event took place.

Because of legal differences regarding divorce, it is difficult to compare the number of divorces and corresponding rates between countries; however, these figures are important as they indicate trends within the countries concerned.

CHAPTER G: MORTALITY

Deaths by age are published by age in completed years.

Life expectancy at various ages is supplied by Member States, for 1960-85. After 1985 it has been recalculated by Eurostat.

The distinction between a miscarriage, an early foetal death and a late foetal death (stillbirth) is currently being revised in several countries. Discrepancies between definitions lead to variations in the measurement of perinatal mortality.

Definitions of late foetal deaths (stillbirths) are given in the table 4.

Table 3: Sources of data on international migrations

Computerized central population register	Entry / exit form	Sample survey	Indirect Sources for non-nationals ⁽¹⁾
Belgium	Germany ⁽²⁾	Ireland ⁽³⁾	Greece
Denmark	Spain	United Kingdom ⁽⁴⁾	France
Luxembourg	Italy		Portugal
	Netherlands		

(1) No source is available for nationals.

(2) There is a parallel source for the foreign population, namely the Ausländerzentralregister.

(3) A specific question is included in the Labour Force Survey.

(4) International Passenger Survey: voluntary survey organised by the OPCS at points of entry into the country; each year some 1 000 of the 100 000 people leaving the country can be considered emigrants, and some 2 500 of 60 000 people coming into the country can be considered immigrants.

Table 4: Current definitions of foetal death

Country	Minimum gestation period	Other criteria
Belgium	26 weeks (180 days)	
Denmark	28 weeks (196 days)	
Germany	-	Weight of foetus at 1 000 gr.
Greece	28 weeks (196 days)	
Spain	28 weeks (196 days)	
France	26 weeks (180 days)	
Ireland	28 weeks (196 days)	
Italy	28 weeks (196 days)	
Luxembourg	28 weeks (196 days)	
Netherlands	24 weeks (168 days)	
Portugal	22 weeks (154 days)	and / or at least 500 gr. and 25 cm
United Kingdom	24 weeks (168 days)	

Causes of death are defined on the basis of the World Health Organization International's International Classification of Diseases.

390-459 Diseases of the circulatory system

140-208 Malignant neoplasms, of which:

151, 153, 154 malignant neoplasms of stomach, colon, rectum, rectosigmoid junction and anus

162 malignant neoplasms of trachea, bronchus and lung

174-180 malignant neoplasms of female breast and cervix uteri

250 Diabetes

480-486 Pneumonia

490-493 Bronchitis, emphysema and asthma

E800-E949 Accidents and disasters, of which:

E810-E819 motor vehicle traffic accidents

E950-E959 Suicide and self-inflicted injury

Statistics on AIDS deaths have also been included.

CHAPTER H: POPULATION BY NATIONALITY

Countries use different sources to record their population by nationality.

Some Member States use their population registers (Belgium, Denmark, Federal Republic of Germany, Italy, Luxembourg, Netherlands), whilst others supply figures from the last population census (France), estimates derived from the Labour Force Survey (Ireland and United Kingdom) or simply count the number of residence permits (Portugal).

Spain and Greece base their annual estimates on the latest census.

CHAPTER I: POPULATION PROJECTION

The most recent population projections, compiled between 1990 and 1992, are made by the national statistical institutes of the member states. The relevant hypotheses are shown after the tables.

**REPORTS ON THE DEMOGRAPHIC
SITUATION OF THE COUNTRIES**

BELGIUM

Population

In 1992 the population of Belgium increased by 46 322, of which 20 441 was due to natural growth and 25 881 to migrations.

The number of foreign nationals decreased by 13 000 following the acquisition of Belgian nationality by 46 000 of them. This is a result of the recent amendment to legislation on the conditions for obtaining Belgian nationality (see below).

Marriages and divorces

In 1992 the number of marriages stood at 58 250, having reached 65 000 in 1990, thus returning to the average for the period 1983 to 1988, when the number had varied between 56 000 and 60 000.

The number of divorces has continued to increase, rising to 22 300 in 1992, a level never before seen. There were therefore 2.6 marriages per divorce, and only 1.9 marriages per divorce in the Brussels region.

Births

The number of births in 1992 fell slightly compared with 1991 (124 000 as against 126 000). The short-term fertility indicator was up slightly at 1.6.

Mortality

The number of deaths has remained the same since 1987 at around 105 000. In 1990 life expectancy was estimated at 72.5 years for men and 79.2 years for women. There has been considerable progress here in comparison with the figures for 1970: 67.5 years for men and 74 years for women. On average, life expectancy has increased by one year every four years.

The infant mortality rate has been falling for more than 20 years. For females, it has fallen from 18% in 1970 to 6% at present, and from 26% to 8% for males. There has also been an increase since 1970 in the proportion of people reaching 80, from 23% to 34% for men and from 42% to 59% for women.

Migration

The migratory balance in 1992 (+ 25 000) was of the same order as in 1989 (+24 000). Prior to then, one has to go as far back as 1975 to find a similar migratory balance (+ 25 000). It was close to zero from 1984 to 1988 and a few thousand either way between 1976 and 1983. In 1992, nationals from the following countries bore most heavily on the migratory balance: Netherlands (+3 274), Morocco (+ 2 813), France (+2 641), Portugal (+ 2 575), Turkey (+2 155) and Zaire (+2 151).

As at 1 January 1993, the bulk of foreign nationals (accounting for 73% of the total) were of the following nationalities:

Italian: 217 534 (23.9%), Moroccan: 144 993 (15.9%), French: 95 165 (10.5%), Turkish: 88 269 (9.7%), Dutch: 69 712 (7.7%) and Spanish 49 459 (5.4%).

Government decisions and legislation

The Law of 13 June 1991 (*Moniteur Belge*, 3 September 1991), which came into force on 1 January 1992, amended the Belgian Nationality Code in order to facilitate the acquisition of Belgian nationality by second- and third-generation foreign nationals.

As regards third-generation foreign nationals, Belgian nationality is automatically granted to children born in Belgium of a parent born in Belgium and with main residence there for five of the last ten years prior to the birth of the child.

This new regulation for the automatic granting of Belgian nationality applies to all persons under 18 on 1 January 1992.

As regards second-generation foreign nationals, children born in Belgium acquire Belgian nationality if their parents or adoptive parents have applied for Belgian nationality for the child before he/she has reached the age of 12. The child's parents or adoptive parents have to have had their main residence in Belgium for the ten years prior to the application and the child has to have had his/hers there since birth.

Foreign nationals born in Belgium and having their main residence there since birth may also, if they are at least 18 but under 30, acquire Belgian nationality by making a declaration of nationality.

The result of these new provisions was that 46 000 people acquired Belgian nationality in 1992 as against a usual figure of 8 to 9 thousand per annum. It is estimated

that a little under 75% of the naturalisations which took place in 1992 related to third-generation children.

DANMARK

Population Change

The population of Denmark stands at 5.180.600 as of 1st January, 1993. The population increased by 18.500 or by 0,35% in 1992. More than 60% of the growth was due to net-immigration (11.500).

In the preceding year the growth only amounted to 0,31% of which two thirds was generated by excess of immigration.

With a few exceptions the annual growth of the Danish population has been below 0,3% since around the middle of the 1970s and was even negative at the beginning of the 1980s. In the same period both natural increase and net-immigration displayed substantial fluctuations. The rate of natural increase was f.ex. negative from 1981 to 1987.

Fertility

The number of live births for 1992 showed a substantial increase compared with the preceding year. In 1992 the number of live births amounted to 67.700 (1991: 64.400), generating an increase in the total period fertility rate from 1,68 to 1,76.

An outstanding feature of the present demographic situation in Denmark is the sharp decline in fertility since 1966. The total period fertility rate declined from 2,62 in 1966 to 1,38 in 1983. The decrease in fertility coincides with an increase in the mean age of women at first birth. In the following period there has been a moderate recovery of fertility, partly resulting from shifts in the timing pattern of birth inside generations. However, the present

level of fertility is still nearly 14% too low to ensure reproduction of population.

Due to the significant increase in the number of consensual unions since 1960s the number of extra-marital live births has grown from around 10% to 46%.

Marriages and Divorces

The number of marriages displayed a moderate increase, viz. from 31.100 in 1991 to 32.200 in 1992. The cumulated first marriage frequency for women increased from 0,59 to 0,61.

Since 1991 the number of divorces has only increased slightly (from 12.700 in 1991 to 13.000 in 1992). Since the middle of the 1960s Denmark has experienced major changes in formal family patterns : a sharp decline in entrance to legal marriage and an increasing incidence of dissolution of legal marriage by divorce. However, due to a substantial number of consensual unions, changes of the proportion of legal and consensual unions in the single age-groups has been moderate.

Mortality

Life expectancy at birth in 1991-92 was 72,7 years for men and 77,8 years for women. In 1976-80 the values were 71,2 years and 77,2 years respectively. The infant mortality rate in 1992 was 6,6 per thousand compared with 7,3 per thousand in the preceding year.

In 1992, 67,4 % of the deaths was caused by cancer and diseases of the circulatory system.

GERMANY

At the end of 1992, Germany had 80 975 000 inhabitants, 700 000 (0.9%) more than at the end of 1991. This increase is accounted for entirely by developments in the pre-unification FRG, where the population increased by 1.2% in the course of 1992. The decline in the population of the new Länder and East Berlin, a trend which has been observed since 1988, continued, albeit at a slower rate. At the end of 1992, this part of Germany had 0.7% fewer inhabitants than at the end of 1991. This decrease is accounted for by natural change and by emigration to western Germany. In 1992, 199 000 people moved from the new Länder and East Berlin to western Germany, while 110 000 moved from west to east. This means that net emigration from the new Länder and East Berlin was 88 000, although this figure is little more than half the 169 000 recorded in 1991.

The increase in Germany's population in 1992 is attributable to the fact that 788 000 more people entered the country than left it. This net immigration figure, which includes a small adjustment for net immigration in 1991, was more than sufficient to offset the natural population decline of 76 000.

The increase in total population appears to have continued into 1993, despite the fall in the population of the new Länder and East Berlin. However, as a consequence of a slight decline in the number of ethnic Germans entering the country from Eastern Europe, and a drastic fall in the number of asylum seekers, population growth is likely to have been less marked than in 1992. In the period from January to October 1993, 169 000 ethnic Germans were admitted into Germany from Eastern Europe, 3% fewer than in the same period of 1992. Between January and November 1993, 311 000 foreigners requested asylum in Germany, a decline of 96 000, or nearly 24%, compared with the same period the year before. This dramatic decrease is due to the new law on asylum, which came into force on 1 July 1993. At the end of June 1993, there were nearly 6.8 million foreigners settled in Germany. This figure is likely to have risen above 7 million by the end of the year.

453 000 couples were married in Germany in 1992, nearly 1 000 fewer than the year before (-0.2%). The number of marriages in the pre-unification FRG rose slightly to 405 000 (+0.4%), whereas the number in the new Länder, already very low, declined by a further 4.5% to 48 000. In 1990, there were 102 000 marriages in the new Länder and East Berlin, and 516 000 in Germany as a whole.

135 000 marriages were dissolved (-1.0%) in 1992. In the pre-unification FRG, the number declined to 125 000 (-2.1%). In the new Länder and East Berlin, the number

of divorces rose to 10 000 from the previous year's figure of 9 000, a very low total which was due in part to changes in the divorce law. In Germany as a whole, 101 000 children were affected by the dissolution of their parents' marriage. In the pre-unification FRG, the divorce rate, as measured in terms of the dissolution of marriages of a certain age, has fluctuated by 30% in recent years.

There were 809 000 live births in 1992, 21 000 fewer than in 1991 (-2.5%). In the pre-unification FRG, there was only a small drop (-0.2%) compared with the previous year, whereas the number in the new Länder and East Berlin fell by 18% to 88 000. In 1990, there were 906 000 live births in Germany, including 178 000 in the new Länder and East Berlin. The total fertility rate in 1992, like that in 1991, is therefore likely to have been less than 1.0, compared with 1.5 in 1990. This sharp decrease in the number of births (and marriages) reflects the breakdown of social institutions in the new Länder. The total fertility rate in the pre-unification FRG in 1991 was 1.4.

In western Germany, 11.6% of live births in 1992 were outside of wedlock. The corresponding figure for eastern Germany was 41.8% (Germany as a whole: 14.9%).

100 000 of the 809 000 children born in Germany in 1992 were non-German nationals.

The number of deaths in Germany in 1992, at 885 000, was 2.8% fewer than the year before. There were declines both in the new Länder plus East Berlin (-6.1%) and in the pre-unification FRG (-1.9%).

In 1992, the number of deaths exceeded the number of live births by 76 000 (1991: 81 000). The number of deaths in the new Länder exceeded the number of live births by 102 000, whereas there were 26 000 more live births than deaths in the "old" Länder. The latter figure is accounted for by non-German children. Among the foreign population, there were 87 000 more births than deaths, whereas there were 62 000 more deaths than births among Germans.

Life expectancy at birth, measured using the mortality rates for 1986/88, was 71.7 years for men and 78 years for women. The corresponding figures for the pre-unification FRG were 72.2 years for men and 78.7 years for women, higher than the 69.8 years and 75.8 years respectively in the new Länder.

GREECE

Population

At the beginning of 1992 the population of Greece was 10 280 000. The annual rate of increase for 1992 was 6.4 persons per 1 000 head of population, corresponding to a coefficient of 0.6 for the natural increase (i.e. the difference between the birth rate of 10.1 and the death rate of 9.5 during 1992) and a coefficient of 5.8 for net migration. Thus, by 31 December 1992, the estimated population of Greece was 10 346 000.

During the 80s, and up until 1992, the age structure, based on the total calculated population, underwent significant changes. These focused on three age groups. The proportion of children aged 0-14 fell from 22.4% in 1981 to 18% in 1992, whilst the proportion of persons of pensionable age (65 and over) increased from 13.2% in 1981 to 14.5% in 1992. The economically active population, i.e. the 15-64 age group, increased some three percentage points, from 64.4% in 1981 to 67.6% in 1992. In absolute terms, the 0-14 age group in 1992 was 15% down on 1981, the economically active population (15-64) up 12%, and the elderly (65 and over) up 16%.

The age structure showed a clear shift towards the older ages, the ageing index rising sharply between 1981 and 1992. In 1992, it was 81 persons aged 65 or over per 100 persons aged 0-14, compared with 59 in 1981.

The ageing of the population has also affected the economically active population, the proportion of 45-64 year-old having increased from 23.4% of the total population in 1981 to 24.7% in 1992.

A comparison of the results of the 1991 and 1981 population censuses shows that the geographical distribution of the population has been clearly influenced by the urbanisation of the population. The semi-urban population showed a slight increase only, in contrast to the share of the rural population, which fell slightly compared with 1981.

It should be noted that the bulk of the urban increase was borne by cities of medium size, and not by the two large conurbations of Athens and Thessaloníki.

Marriages and divorces

The crude marriage rate showed a marked fall in 1992 at 4.7 marriages per 1 000 head of population, compared with 6.4 for 1991 and 7.3 at the beginning of the 80s.

The overall nuptiality rate at first marriage for women aged under 50 showed a downward trend during the 80s, falling to 0.82 in 1991 and 0.59 in 1992. This trend has had a negative effect on the number of births.

The divorce coefficient showed an upward trend, from 89.2 divorces per 1 000 marriages in 1981 to 96.9 divorces in 1991 and 126.5 in 1992.

These major differences in the marriage and divorce indices between 1991 and 1992 are due to the fact that during 1992, which was a leap year, there were far fewer marriages than in 1991.

The average age of women at first marriage gradually increased by some two years, rising from 22.3 years in 1981 to 24.1 years in 1991 and 24.4 years in 1992.

The overall divorce rate fluctuated during the 80s. This was largely due to the establishment of divorce by mutual consent and of the principle of "irreversible breakdown of marriage", which simplify divorce proceedings. Thus, up till 1983, the overall divorce rate stayed at 8 per 100 marriages, between 1984 and 1988 the rate increased to between 12 and 14, whilst between 1989 and 1992 the rate began to fall slightly, stabilizing at around 12 divorces per 100 marriages.

The crude divorce rate showed the same trend during the eighties, fluctuating between 0.6 and 0.9 divorces per 1 000 head of population and stabilizing at 0.6 during the last three years (1990-92).

Fertility

Fertility in Greece during 1992 remained at the same low level as the previous year. The crude birth rate showed a downward trend between 1982 and 1992, falling from 14 births per 1 000 head of population in 1982 to 10.1 in 1991, remaining at this level in 1992.

During the previous decade, and until late 1992, the total fertility rate fell steadily. From 2.09 births per mother in 1981 - just below the replacement level (2.1) - it fell to 1.62 in 1986. This downward trend continued in 1991 (1.40) and 1992 (1.39), remaining well below the replacement level. The net reproduction rate, which corresponds to the total fertility rate, was 961 daughters in 1981, 659 in 1991 and 654 in 1992, continuing the downward trend in this index.

This fertility trend had a negative impact on Greece's natural population increase, the birth surplus having fallen steadily from 54 692 in 1981 to 7 122 in 1991 and 5 850 in 1992.

The fertility rate by age group for the last four years (1989-92) shows a shift away from the 20-24 age group (which was the most fertile group from the early 80s until 1988) to the older age groups, particularly the 25-29s. This is related to the increase of some two years in the average age of mothers at the birth of their first child (itself the result of the two-year increase in the average age of women at first marriage): having stabilized at 23 years in the early 80s, it began to rise after 1985, reaching 25 years in 1991 and 25.4 years in 1992.

The number of births by order of birth decreased proportionately between 1981 and 1992, meaning that the ratio of births by order has remained about the same.

Births outside marriage showed a marked increase in 1992 at 2 745, giving a ratio of 26.4 per 1 000 live births. The equivalent figures for 1991 were 2 447 and for 1981 2 234 (ratios of 23.8 and 14.6 respectively).

Mortality

The crude mortality rate showed a slight but steady upward trend during the 80s, fluctuating between 8.9 deaths per 1 000 head of population in 1981 to 9.5 deaths in 1992. This slight increase was mainly attributable to the rise in the number of deaths of persons aged 75 or over as a result of the ageing of the population.

Specific coefficients by sex and age for both the eighties as a whole and the last two years (1991 and 1992) show a clear downward trend for the 0-14 age group and a similar trend (with slight fluctuations) for the 40-74 age group. By contrast, specific indices show a clear upward trend for persons aged 15-39 and 75 and over, this being due mainly to the increase in the number of road accident deaths and the ageing of the population.

The average age at death, which in 1981 was 68.6 for men and 73.8 for women, increased steadily by three years during the eighties, rising to 71.6 for men and 77 for women by 1992. The corresponding figures for 1991 were 71.4 and 76.6.

The infant mortality rate gradually declined, the steady annual decrease bringing the figure down from 16.3 deaths per 1 000 live births in 1981 to 9 in 1991 and 8.4 in 1992, with the prospect of a further reduction.

Expectation of life at birth showed a clear upward trend. For men it increased from 72.2 years in 1981 to 74.0 years in 1991, and for women from 76.5 years to 79.4 years, thus broadening the gap between men and women from 4.3 to 5.4 years.

As regards the causes of death over the 1981-92 period, first position was held by heart disease, followed (in decreasing order) by neoplasms, cerebrovascular disease and diseases of the respiratory system, fifth position being held by accidents.

Migration

Data on migratory flows are taken from the official (legal) residence permits granted to arriving immigrants.

In 1981 there were 85 633 foreign nationals legally resident in Greece. There was a slight fall during 1986-89, then the figures rose to 189 582 in 1991 and 203 112 in 1992. There was thus an increase of 121% between 1981 and 1991.

The breakdown of immigrants by continent of origin for 1981 was as follows: Europe 47.03%, America 20.20%, Asia 20.12%, Africa 11.16% and Oceania (Australia etc.) 1.49%. The increase recorded in 1991 was mainly due to the 152% rise in the number of immigrants from Europe.

There was a 5.15% increase in the number of immigrants between 1990 and 1991, and a 7.13% increase between 1991 and 1992.

In addition to official immigrants, it is estimated from various sources (mainly the press) that there is a significant but unconfirmed number of illegal immigrants in Greece, mostly economic refugees from neighbouring countries.

Government decisions and legislation

No new legislation providing maternity protection incentives was passed in 1992. The 1990 regulations remain in force. These lay down family allowance measures providing monthly payments to mothers expecting their third child and a life pension for mothers who already have five or more children. However, data so far available on births in 1991 and 1992 show that this has had virtually no positive impact on the birth of third children.

In late 1991 an Interparty Parliamentary Commission was set up "to study the demographic problem in Greece". After completing its work, the Commission submitted its findings and drew up proposals for effectively combatting the demographic problem.

SPAIN

Population

In the decade 1981-1990, the Spanish population shows the lowest inter-census demographic increase in the whole century, the increase being 3,2 %, with a tendency to a further decrease.

At the end of 1993, the estimated population is 39,2 millions of inhabitants, which implies an increase for the year in question of only 0,13 %, slightly inferior to 0,14 % registered in the previous year.

Independently of other factors, the main reason why the growth of the Spanish population is slowing down, is the diminishing natural increase as a consequence of the constant and considerable decrease of fertility in Spain since the end of the seventies.

The decreasing average number of children per woman is also the first factor with an influence on the ageing of the Spanish population. The second in importance is the decrease of mortality. As to migrations, figures on net migration are positive and increasing their importance, although they have not yet attained enough important as to significantly influence age structure.

The population aged 65 and older, amounting in 1980 to 4.230.000 persons, increases with little more than a million persons and 24,8 % in the following ten years, amounting at the end of the 1990's to about 5.300.000 inhabitants.

This means that the percentage of the population aged to 65 and older switches from 11,2 in 1980 to 13,5 in 1990.

Marriages and divorces

In 1980, 221.000 marriages were recorded in Spain with a gross marriage rate of 5,9 per thousand. In 1981, when the Divorce Act was passed, almost 20.000 less were recorded, the rate being 5,4 per thousand; from this year onward, a sub-recording occurs in the amount of marriages because of the refusal of some of the country's dioceses to send the corresponding marriage bulletins.

In 1982, 193.000 marriages are enumerated with a 5,1 rate. Since then, the figure of recorded marriages and the corresponding rate, tend to increase being 220.000 marriages and 5,7 in the year 1990. A slight decrease is observed in the next years final figures being 218.000

and 5,6 for 1991 and 211.000 and 5,4 provisional figures for 1992.

In 1981, the Divorce Act is passed in Spain, 9.500 divorces being enumerated in six months, with a gross divorce rate of 0,3 thousand. In 1982, the figure of divorces is 20.000 and the rates 0,6 per thousand inhabitants.

Between 1981 and 1989, the annual average is 20.000 divorces and the gross rates, 0,5 per thousand inhabitants, there being a slight increase since 1985. In 1992 27.000 divorces, 0,7 per thousand inhabitants, are recorded.

Fertility

Live births in Spain, constantly decreasing since the late seventies, going down to 571.000 in 1980 with a gross birth rates of 12,3 per thousand, go beyond 400.000 in the year 1991, the figure being 396.000 live births, while the gross birth rate is 10,1 per thousand. The provisional figures for 1992 are respectively, 390.000 and 10,0.

Total number of births outside marriage registers an increasing trend being 22 and 40 thousands, respectively for 1980 and 1991 (3,9 % and 10,0 % in respect of total births).

The decrease of births means, in terms of fertility, that the average number of children per woman has gone, in ten years, to 39,5 % below the replacement level. Thus, whereas in 1980 the total fertility rate was 2,2, the constant decrease lowers it to 1,33 in 1990 and 1,30 in 1991, which is the last year for which final birth figures are available, the estimation being of 1,22 for 1994.

For the decreasing fertility, only a minimum slowing down is shown, it is therefore hazardous to think, without any other authority, that it is impossible to decrease still more or that the average number of children per woman will be recovered.

Mortality

In the decade of the eighties, the figure of deaths as well as the gross mortality rate, shows a tendency to increase. In 1980, 290.000 deaths and a gross rate of 7,7 per thousand are recorded, which attain respectively, in 1991, 338.000 deaths and a rate of 8,7, according to the information of available for that year.

As to the number of deaths of children aged less one year, it is declining and reduced to less than half throughout the decade, as a result of the lower number of births. Infant mortality rate tends to diminish and is 12,3 per thousand in 1980, whereas it attains 7,2 in 1991.

The age mortality rates keep growing lower in the decade of the eighties, although the improvement is less noteworthy than in the seventies, except rates for 18 to 35 years which show an increasing trend in the last years, noteworthy in males.

Life expectancy at birth of the Spanish population in 1990 as 76,9 years, being 73,4 years for men and 80,5 for women.

Migrations

Information on departure abroad, i.e. on the number of emigrants, is obtained from the only available source,

the Assisted Emigration statistics. In the 1981-1990 period, a very low number of departures, about 50.000, is recorded, a figure whose coverage in relation to emigration cannot be accurately estimated; in any case, the emigration in question is that assisted by the Ministry of Labour.

Foreigners residing in Spain are still a very low percentage, about 1 per cent of the total population in 1992, but its tendency is to a slowly increase.

As for emigration, it is difficult to estimate the coverage of immigration by the existing sources.

In the decade of the eighties, the net migration is positive, although its annual quantity is only slightly over 15.000 arrivals, which represents about 0,04 per thousand inhabitants. The important fact is that it registers a growing upwards trend.

FRANCE

On 1 January 1993, the population of metropolitan France stood at 57.5 million. There were fewer births in 1992 than in the previous year. There was a fall in the number of deaths and an increase in life expectancy. The marriage rate was the lowest in four years.

During 1992, some 743 400 births and 521 400 deaths were recorded in metropolitan France. An estimated positive migratory balance of 90 000 increased the total population by 312 000. This increase of +0.5% is in line with the average rate for the past ten years.

Fall in the number of births in 1992

743 400 children were born in 1992. Between 1989 and 1991 there was a slight but steady decline in the number of births (- 0.5% per year). In 1992, the fall was more marked at 15 000, or - 2.1%. As 1992 was a leap year, this figure should be increased by 2 000, which is approximately equal to the number of births per day. Falls have been recorded at other times in the past: in 1983, the drop in the number of births was even greater, though this did follow on from a period of particularly high birth rates during the 1980 and 1981.

As the number of women of child-bearing age was stable, the fall recorded in 1992 reflects a drop in fertility. Since the major turnaround in 1975, the total fertility rate has remained fairly stable at between 177 and 195 children per 100 women (1990-91 and 1981 respectively). In 1992, the figure fell to 173.

The fall in this indicator in 1992 is due to a further fall in fertility to 27-28 years, and to a less marked increase beyond this age. If these trends continue, not only will there be a birth gap after a while, but the completed fertility of the 1960 and later generations will be affected. These generations are less fertile than previous generations, and have accumulated a deficit over the 80s. Thus, in 1990, 100 women born in 1962 had given birth to 118 children by the age of 28, which is 13 and 22 children fewer than the equivalent figures for women four and ten years their seniors.

Fewer marriages

There were 271 427 marriages in 1992. The trend in the number of marriages over the past five years has been uneven. The upward trend of 20 000 additional marriages between 1988 and 1990 appears to have stopped, the fall observed in 1991 (- 7 000) continuing in 1992 (- 9 000). The marriage rate is at a record low, with 47 marriages per 10 000 inhabitants.

Though marriages of single people account for over 80% of the annual total, fewer single people are getting married. Since 1991, the first-marriage indicator has fallen compared with 1988-90. If the marital status of women observed in 1992 were maintained for the rest of their lives, 47% would stay single (as in 1988), compared with 45% in 1989 and 1991.

The trend observed over the past few years looks set to continue: people are marrying later and less frequently. The fall in marriage rates amongst the younger age groups is continuing, and has even reached women aged 25, whilst the recovery in nuptiality above this age is less marked. Younger generations are marrying later and are less interested in marrying: whilst 80% of women born in 1953 were married by the age of 28, the equivalent figure for women born in 1963 is a mere 60%.

Life expectancy steadily increasing

Deaths in 1992 were estimated at 521 400, or 0.6% down on 1991. Once allowance has been made for the growth - and, more importantly, the ageing - of the population, this translates as a renewed fall in mortality.

Life expectancy at birth rose once again in 1992. In ten years there has been an increase of 2.5 years. There is an estimated downward trend in infant mortality, at 6.8 deaths amongst infants under one year for every 1 000 live births. Mortality remained stable at younger ages, and appeared to increase amongst men aged 25 to 45. The bulk of the increase in life expectancy is currently for the over-45s.

In 1992, life expectancy was estimated at 81.4 years for women and 73.2 years for men. The gap of just over eight years between men and women is stable over time.

Estimate of migrations

The migratory balance is based essentially on statistics on arrivals of foreign nationals as recorded by the International Migrations Office (OMI). Comparison of the last two censuses also provides data on the flows of French nationals and the departure of foreign nationals.

In 1992, according to the definition used by the Haut Conseil à l'Intégration (Supreme council for integration), immigration increased to 110 000. The fall in immigration by members of the same family and in the number of

recognised refugees was more than offset by the increase in work-related immigration. This increase was attributable to the exceptional granting of residency to asylum seekers previously refused entry, and more especially to the free movement of Iberian workers within the European Union, which prompted the immigration of some 15 000 Portuguese workers. However, the migratory balance for 1992 stabilised at + 90 000 persons.

Population growing but ageing

The net outcome of these movements - births, deaths and migrations - was an increase in the population, basically as a result of the natural surplus, even though this fell in 1992, having been stable over the previous three years. The birth rate of 13 per thousand and the death rate of 9.1 per thousand were the lowest recorded

since the Second World War. The natural growth rate fell to below 4 per thousand, as in 1975-78 and 1983.

The falls in the birth and death rates have contributed to the continued ageing of the population. Of the 57.5 million inhabitants on 1 January 1993, 26.8% were under 20 and 14.5% 65 or over. In 1983, these figures were 29.8% and 13.2% respectively. The 20-64 age group increased its share from 57% of the population to 58.7% in 1992.

IRELAND

Marriage

There has been a steady downward trend since 1980 in the number of marriages registered. In 1980 there were 21,800 marriages compared with 16,109 in 1992. The annual marriage rate per 1,000 population which fell from 7.4 in the early 1970's to 6.4 in 1980 has continued to decline to 5 in 1991 and 4.6 in 1992.

Fertility

The number of births registered in 1992 was 51,557 (26,567 males and 24,990 females), a slight decrease on the 1991 total of 52,688. The total number of births, declined from a peak of 74,388 in 1980 to a low of 51,659 in 1989, increased to 52,688 in 1991 and has stabilised at 51,557 in 1992. The birth rate per 1,000 population was 14.6 in 1992 compared to 21.9 in 1980. About one in every six births was outside marriage in 1991 and 1992 compared to one in 20 in 1980. This share has been increasing steadily in recent years.

The age specific fertility rate for most age groups remained fairly stable between 1991 and 1992. The total fertility rate which declined by about 35 % from 3.23 in 1980 to 2.13 in 1989, increased to 2.18 in 1991 and has now stabilised at 2.11 in 1992.

Mortality

There were 30,930 deaths in 1992, compared to 31,544 in 1991 and 32,980 in 1980. Heart disease remains the

biggest single cause of death and accounted for 34 % of the total deaths in 1980 and 32 % in 1991 and 1992. The number of deaths due to malignant neoplasms has shown a steady increase over the same period and accounted for 23 % of total deaths in 1991 and 24 % in 1992, compared to 19 % in 1980. Diseases of the respiratory system accounted for 4,370 deaths in 1980 (13 %) in 1992. Motor vehicle accidents accounted for 581 deaths in 1980 (1.8 %), 434 in 1991 (1.4 %) and 434 in 1992 (1.4 %).

Infant mortality

The number of infant deaths declined sharply between 1980 and 1992. The number in 1988 was 821 or 11.1 per 1,000 births compared to 431 in 1991 and 344 in 1992 or 7.6 or 6.5 respectively per 1,000 births. The greatest number of deaths were attributed to congenital anomalies and accounted for 33 % of the total infant deaths in 1980 compared with 43 % in 1991 and 39 % in 1992. Sudden infant deaths accounted for 17 % in 1980, 17 % in 1991 and 16 % in 1992.

Life Expectancy

The latest set of life table for Ireland relate to the 1985-1987 period. These tables show continuing increased life expectancy for both males and females. The life expectancy at birth was 71.0 years for males and 76.7 years for females. For the 1980-82 period, male life expectancy was 70.1 years and female life expectancy was 75.6 years.

ITALY

Foreword

The main features of the current demographic situation in Italy are continuing extremely low fertility and ever-improved longevity rates, placing Italy among the countries with the lowest mortality and fertility rates. The combination of these two factors explains the fundamental ageing recorded in the Italian population.

Population movement

In 1992, the natural balance established on the basis of demographic data on the resident population showed an increase of around 30 000 (cf. Table 1), 19 000 units more than the equivalent value for 1991 (9 000 units). This figure has to be considered an overvaluation, because the 1991 figure was an underestimate of around 10 000 units due mainly to the changes made by register offices on the occasion of the population census of 20 October 1991. The figure of 30 000 units is, moreover, less than one-third of that recorded ten years previously (97 000 units).

Table 1 : Balance of resident population (1000)

	1982	1991	1992
Natural balance	97.0	9.0	30.2
Balance of migration	-22.6(e)	33.3	172.9
Total balance	74.4(e)	42.3	203.1
Total population at the end of the year	56 615.8(e)	56 757.2	56 960.3

(e)provisional estimate: the population data for the decade between censuses (1982-1991) were obtained by means of a provisional recalculation based on the population recorded in the census on 20 October 1991. To save space, subsequent tables will omit references to provisional estimates.

The increase in migration was 173 000 units, therefore noticeably greater than the 1991 figure (33 000 units). This development has to be closely linked to the process whereby, in subsequent years, municipal records pick up on population units missed out in the census.

Furthermore, in 1992, the national balance of migration showed an increase of around 64 000 units.

The above remarks indicate that the entire balance of population recorded in 1992 (203 000 units) is to be attributed to the "settling" of the registered balance which

is for the greater part to be traced back to the post-census "recovery" stage.

In other words, as an aggregate, Italy's population of 56.960 million units at the end of 1992 could essentially be described as showing meagre natural growth, even tending towards zero-growth, with foreign migration increasing by the order of one per thousand.

Fertility

Over the period under review (cf. Table 2), live births among the resident population fell from 619 000 units in 1982 (equal to 10.9 live births per thousand inhabitants) to 561 000 in 1992 (a birth rate of 9.9%), a decline of just under 10%.

Table 2 : Live births and births out of wedlock in the resident population (1000)

	1982	1991	1992
Live births	619.1	562.8	560.8
Ratio per 1 000 inhabitants	10.9	9.9	9.9
Live births out of wedlock	29.1	37.8	37.8
Ratio per 1 000 live births	46.9	67.2	67.3
Total fertility	1.60	1.26(s)	1.25(s)

(e) estimate

There was also a slight fall (around 2 000 units) on 1991. Illegitimate births (live births out of wedlock) underwent a marked increase. From 29 000 in 1982 (47 per 1 000 live births), they climbed to 38 000 in 1992, a rise of 30% which pushed the illegitimacy rate to over 63 per thousand. The total fertility rate fell from the already very low level of 1.60 children per woman in 1982 to 1.26 in 1991 and to 1.25 in 1992, which, beyond any doubt, can be considered the lowest values currently reached by any large population groups.

Marriage and divorce rates

The number of marriages, which in 1991 stood at the same level (312 000 units) as in 1982, fell to around 304 000 in 1992, giving a marriage rate of 5.3 per thousand inhabitants, as against the previous rate of 5.5.

Table 3 : Marriages and divorces (1000)

	1982	1991	1992
Marriages	312.5	312.1	303.8(p)
Ratio per 1 000 inhabitants	5.5	5.5	5.3(p)
Total index of first marriages	732	681(e)(a)	663(e)(b)
Divorces	14.6	27.4	26.0
per 100 continuing marriages	0.9	1.9	1.8

(e) estimate; (p) provisional; (a) 1990; (b) 1991

A better assessment of the incidence of marriage can be obtained from a more significant indicator such as the cumulated first marriages frequency (by women up to 50 years of age). This indicator shows that, in the period 1982-1991, the phenomenon in fact declined considerably (by nearly 10%, from 732 to 553 per thousand). On the other hand, the very marked leap in the divorce rate (almost doubling in the ten years considered) is essentially linked to the changes made to the legislation in this domain in 1987 and especially to the law which cut the minimum period between legal separation and divorce from five to three years. In relative terms, measured against continuing marriages, the divorce rate rose from 0.9% in 1982 to around 2% in 1991-1992.

Mortality

The absolute number of deaths (cf. Table 4) fluctuated from one year to another over the decade, from a maximum of 564 000 units in 1983 to a minimum of 532 000 in 1987 and 1989. In view of the modest increase in the total population, the varying number of deaths meant a corresponding fluctuation in the death rate between a high point of 10 per thousand and a minimum of 9.4 per thousand.

Table 4 : Deaths, infant mortality and average life expectancy at birth

	1982	1991	1992
Deaths (1000)	534.9	553.8	541.4(p)
Rate per 1 000 inhabitants	9.5	9.8	9.5(p)
Infant mortality	13.0	8.1	8.3(p)
Average life expectancy at birth			
males	71.51	73.50(a)	73.59(b)
females	78.21	80.03(a)	80.20(b)

(p) provisional; (a) 1989; (b) 1990

A quite different picture of Italian mortality is provided by the life expectancy at birth, which rose steadily between 1982 and 1992 for both sexes: by two years for males and a little less for females, who had crossed the 80-year mark the previous year.

As regards mortality in the first year of life, there were very substantial advances between 1982 and 1991: the rate fell from 13 to 8 per thousand, a fall of nearly 38%. The bottoming-out of the downward trend recorded in 1992 would appear, at least in the light of the initial figures for 1993, to have been entirely fortuitous.

Lastly, the breakdown of deaths by broad groups of causes points to the continuing increase in deaths due to malignant neoplasms (the rate per 100 000 inhabitants rose from 223 in 1982 to 256 in 1990 and 261 in 1991) and the continuing decline in deaths from infectious diseases, the rates for which tend to be extremely low (3.4 deaths per 100 000 inhabitants in 1992).

Table 5 : Causes of death (1000)

	1982	1991	1992
Diseases of the circulatory system	251.8	234.8	241.5
per 100 000 inhabitants	445.1	413.8	425.4
Malignant neoplasms	126.1	145.0	148.0
per 100 000 inhabitants	222.9	255.6	260.7
Infectious diseases	3.0	2.0	1.9
per 100 000 inhabitants	5.4	3.5	3.4
Motor vehicle road accidents	9.9	9.1	9.6
per 100 000 inhabitants	17.5	16.1	16.8

On the other hand, both the death rates due to road accidents in motor vehicles and due to diseases of the circulatory system have risen. Having shown a declining trend throughout the 1980s (from nearly 11 000 deaths in 1980 to 8 700 in 1989), deaths from road accidents again rose above 9 000 in 1991, giving a rate of nearly 17 per 100 000 inhabitants. Deaths from diseases of the circulatory system, which had declined slightly between 1982 and 1990 (from 445 to 414 per 100 000), increased in the following year to a rate equivalent to 425 per 100 000.

Government measures and legislation on population

The course of demographic events has been so marked in Italy in recent years that it could not fail to draw the attention of the media and of public opinion in general.

The social and economic impact of factors such as the high number of foreigners in the country and the increasing demographic weight of the elderly increasingly draws the attention of the political classes and, to some extent, influences the government's legislative program. This notwithstanding, 1992 gave evidence of conflicting intentions: in June, on the one hand, the "Ministry for Italians Abroad and Immigration" had its mandate abolished, while, on the other, the "National Committee for Population Problems" was reconstituted within the Prime Minister's Office with the aim of ensuring the coordination of demographic provisions hitherto lacking in Italy.

In July 1992, the "Ministry of Social Affairs" was set up, and its remit for socio-demographic problems was significantly extended in 1993.

Latest statistical publications on demography

In 1992, Istat published four yearbooks on demographic phenomena, specifically those concerning:

- 1) births and deaths for the years 1986-1987;
- 2) marriages for 1988;
- 3) migration of the resident population (again for 1988); and
- 4) the balance of the population registered in municipal register offices for 1990.

Also worthy of mention are a volume on the new population register regulation and a brief report (the first in this area) on demographic events (births, marriages and deaths) in Italy concerning foreign citizens in the period 1986-1988.

Lastly, where the census of 20 October 1991 is concerned, a volume has been published on the "Provisional provincial and municipal results for population and housing".

LUXEMBOURG

Population trend

The marked growth of the past few years continued in 1992, the resident population increasing from 389 800 on 1 January 1992 to 395 000 on 1 January 1993 (+ 1.4%).

As in previous years, the positive natural balance was supplemented by major net immigration, the rates being 2.9% and 10.8% respectively.

Marriages and divorces

Despite a fall of 3.1%, the number of marriages remained very high in 1992. For women, the cumulated first marriage frequency was 0.67.

There was a marked decrease in divorces at - 6%.

Births

The rise in the number of births continued, with a growth rate of 3.7%. The birth rate was 13.1%.

The total fertility indicator rose to 1.67. The results of the 1991 population census (confirmed by Eurostat calculations) show that the completed fertility of women of Luxembourg nationality has always been below the 2.1 threshold.

Mortality

In 1992, there was a marked increase in the number of deaths (+ 7.3%). The mortality rate rose to 10.2%.

The infant mortality rate fell from 9.2% in 1991 to 8.6% in 1992.

The new mortality tables calculated for the period 1990-92 show a life expectancy for men of 72.6 years and 79.1 years for women.

Migration

The net immigration rate has remained above 10% over the past three years. In 1992, 10 696 arrivals and 6 441 departures were recorded. After the Portuguese, ex-Yugoslavian nationals made up the bulk of arrivals.

Population policy

(Source: 1992 report by the Ministry for the Family and Solidarity)

According to the activity report by the Ministry of the Family and Social Aid, "*1992 was a year of major reforms aimed at families [...]. There were three dimensions to the measures taken to benefit families under the government's 1989 programme: the first was direct and indirect taxation; the second was housing allowances, and the third a set of reforms aimed basically at family allowances*". Two bills led to some quite substantial increases in the level of family allowances, education allowances, maternity allowances and schooling expense allowances. Mention should also be made of the funds allocated to day nurseries.

The basic aim of these measures was to give parents free choice regarding their family lifestyle, and to provide support for low-income and large families.

As regards policy measures to benefit the elderly, mention should be made of the work done to extend the aid networks provided for under the programme to allow elderly people to continue living in their houses, convert old people's homes into integrated centres, create new integrated centres and refurbish old infrastructures.

A bill on the integration of foreign nationals and social measures to benefit them has been submitted to the Chamber of Deputies.

NETHERLANDS

Population

In 1 January 1993 total population of the Netherlands numbered 15.2 million inhabitants.

In 1992 the Dutch population grew by 110 thousand, i.e. 8 thousands less than in 1990 and 1991. The number of births fell by 2 thousand, immigration by 3 thousand. The number of deaths remained unchanged. Emigration increased by 1.5 thousand, just like (negative) net corrections. Most of these net corrections were mainly due to delayed processing of unreported emigration in the years before.

In the next century the number of people under 30 is expected to be rather constant. The proportion of (potentially dependent) people under 20 will remain stable in the near future. On the other hand, the ageing of the population will continue.

In 1992 the number of non-nationals in the Netherlands population registers grew by 25 thousand to 757 thousand (i.e. 5.0 % of the total population). External migration, including corrections, accounted for 48 thousand and natural increase for 12 thousand. This total was reduced by 36 thousand non-nationals who became Dutch citizens. The most numerous category of non-Dutch nationals on 1 January 1993 were the Turks (212 thousand), followed by the Moroccans (165 thousand).

An estimated 171 thousand Surinam-born persons were living in the Netherlands on 1 January 1992. Together with the live-born children from parents born in Suriname, there were 272 thousand people from Surinam origin (the vast majority with Dutch nationality). The number of Dutch Antillean (including Aruban) people in the Netherlands on the same date amounted to 95 thousand, of whom 64 thousand were born in the Netherlands Antilles (including Aruba).

Most foreign born populations are relatively young. Those who were born in Indonesia or the former Dutch East Indies are the only (important) exception. This is because many immigrated just after World War II or during the 1950's. After 1962, when Irian Jaya (= former Dutch New-Guinea) became a part of Indonesia, international migration between the Netherlands and Indonesia became modest.

Marriage and divorce

Since 1984 the annual number of marriages had increase steadily, after a period of strong decline from the beginning of the 1970s. This trend was reversed in 1991:

95 thousand marriages (contracted in the Netherlands) against 96 thousand in 1990. In 1992 decrease continued (94 thousand marriages).

11 % of the marriages are contracted between a Dutch national and a foreigner. To a large extent this is due to the increased number of foreigners residing in the Netherlands. On the other hand some of these marriages may be based on the intention to receive a permit to stay in this country. There is no statistical evidence, however, to support this statement.

The number of marriages between Dutch men and women from Eastern Europe (Poland, Russia) or Latin-America (Colombia, Dominican Republic) is increasing fast. The same goes for the number of marriages between Dutch women and men from Egypt or Nigeria.

Divorce was relatively high in 1992. Only in 1983-1985 the number of divorces per 1.000 marriages was higher. Given the number of petitions for divorce as well as the development of the index of the willingness to buy it is expected that a further rise will take place in 1993.

Fertility

There were 197 thousand live born children in 1992, two thousand less than in 1991 and 26 thousand more than in 1983, the year with the lowest post-war level up till now. The growing number of live born children since 1983 is partly due to the increase of women in the fertile ages. That is why the total fertility rate (TPFR) shows a somewhat smaller rise (from 1.47 in 1983 to 1.59 in 1992). The increased period fertility is mainly caused by women who in the past postponed having children to higher ages (30 or over).

In the seventies and eighties more women postponed their childbearing. The mean age of the women at first birth had increased from 24.3 years in 1970 to 28.0 Years in 1992. In the eighties the mean age at first birth of Dutch women was second behind Switzerland compared to other European countries. The age-specific fertility rates under the age of 25 are the lowest in Europe.

In the Netherlands the mean age at first marriage is also relatively high. This is not only related to the high age at first birth, but also to the on-going growth of extra-marital natality. In 1975 only 2 % of all live births were extra-marital births. It was over 10 % in 1988, 11.4 % in 1990 and 12.4 % in 1992.

According to the 1991/1992 age specific fertility rates TPFR for Morocco born women is 4.34. This is about half a child less than in 1989/1990, when TPFR was 4.90.

For women born in Turkey this figure fell from 3.19 in 1989/1990 to 2.95 in 1991/1992.

Mortality

Mainly as a consequence of the population growing older, the annual number of deaths has been gradually increasing (from 114 thousand in 1980 and 123 thousand in 1985 to 130 thousand in 1992).

In 1987 female life expectancy exceeded that of males by 6.6 years, by 1992 this difference had dropped to 6.0. There is no known cause for this phenomenon as yet.

Infant mortality declined steadily in the past (from 8.6 per 1,000 live births in 1980 to 6.8 in 1988/1989). After a brief interruption in 1990 (7.1) this trend continued in 1991 (6.5) and in 1992 (6.3).

Migration

In 1992 immigration reached a level of 117 thousand compared with 120 thousand in 1991. However, most refugees from (former) Yugoslavia were not registered as immigrants. They were so-called 'ontheemden' (displaced persons), and were allowed to stay in the Netherlands until the situation in their country was safe enough for them to return to their homes. They were promised that if this was not the case within twelve months they would receive a permit to stay in this country for a longer period. In practice this means that most of them will be registered as immigrants in 1993.

The number of non-Dutch immigrants fell slightly (from 84 thousand in 1991 to 83 thousand in 1992). The number of non-Dutch EC-immigrants amounted to 21 thousand, one thousand more than the year before. The immigration of Turks (9 thousand) and Moroccans (7 thousand) was lower than in 1991.

The level of emigration was two thousand higher than in 1991 (59 thousand in 1992). Contrary to immigration the greater part of emigration consists of nationals (36 thousand). Non-Dutch EC-emigrants (10 thousand) accounted for almost half of the total non-Dutch emigration.

As a result of the foregoing, net immigration fell by 5 thousand (to 58 thousand). If one takes into account that the "corrections" mainly apply to emigrants who did not notify the municipal authorities of their departure, net immigration dropped even more (including corrections estimated at 50 thousand for 1991 and at 43 thousand for 1992).

The number of requests for asylum, which had increased for many years, also decreased (22 thousand in 1991, 17 thousand in 1992). Here too it should be noted that the refugees from (former) Yugoslavia were also excluded from this number. The number of asylum seekers from Somalia grew fastest.

Projections

According to the most recent forecasts, viz. the 1993-based Netherlands Population Forecasts, the number of inhabitants of the Netherlands will continue to grow for the next 40 years. The maximum population size will be 17.7 million persons. That is 2% higher than according to the previous forecasts, published in 1992. The difference is caused by an adjustment of the assumption on external migration. In the latest forecasts it is assumed that net immigration will stabilize on average at 35 thousand. In the previous forecasts a number of 25 thousand net immigrants was assumed. The main reason for assuming higher net migration is emigration is expected to be lower than assumed before, as a larger percentage of the asylum seekers will not return to the country of origin.

According to the December 1993 household forecasts the number of households will increase from 6.2 million in 1992 to 7.3 million in 2010. The main source of the increase is the rise of the number of one-person households from 1.9 million to 2.7 million. As a result the number of households will increase more strongly than population size. Whereas population size in 2010 will be 11% higher than in 1992, the number of households will rise by 17%.

PORUGAL

Population change

The resident population of Portugal at 1 January 1993 was estimated at 9 859 630. This (provisional) figure was computed from the preliminary results of the Census of 15 April 1991.

The natural population increase in 1992 was +14300, a slight upturn on 1990 (13500) and 1991 (12400). This is 75% down on the 1981 figure.

Net migration was estimated at -10000. Portugal does not maintain complete registers, and this estimate was based on the sum of various sources on international migration, including the data on Portuguese emigration to the place of destination. This figure continues the series of negative balances of the 1980s, although it is less markedly negative than the estimate for 1991 (-25000).

With the very slight gain on natural population increase (+0.14%) and a volatile net migration figure (-10%), Portugal showed a very small net gain in population of +0.04%. This represents a turn-around from the negative growth estimated since 1986.

Fertility

The number of live births continued the decline begun in the early 1980s, with a total for 1992 of 114 900, down by 1.2% on 1991.

The proportion of live births outside wedlock, on the other hand, continued to rise, from 15.6% in 1991 to 16.1% in 1992. This percentage has been growing steadily since 1980.

The total fertility rate for 1992 was 1.46 children per female; slightly down on the 1.574 of 1991. This indicator is, however, now computed on the basis of the population structure of the latest census of population, representing a break with the previous series, which will be adjusted accordingly. It can, however, be stated that fertility has been below the threshold for the replacement of generations since 1982.

The tendency for mothers to be older continued: the mean age of the mother at the birth of a child rose from 27.2 to 27.4 years between 1991 and 1992, and her mean age at the birth of her first child rose from 24.9 to 25.0 years the highest recorded since 1980.

Lastly, the percentage of first and second-order births also rose. First-order births accounted for 52.3% of all live births (52.0% in 1991), second-order births rose from 32.0 to 32.2%. Third-order and fourth and higher-order births declined correspondingly, to 9.3% and 6.3% of the total respectively.

Marriage and divorce

The number of marriages fell from 71808 in 1991 to 69887 in 1992. This was reflected in the marriage rate, which slipped from 7.3 to 7.1. The marriage rate has moved erratically, slipping throughout the first half of the 1980s, rising again during the second, and falling back again since 1989.

The first marriages rate remained stable at 0.84 in 1992.

Marriages are taking place steadily later in life. For males the average age at marriage was 28.1 years in 1992, 0.1 years older than in 1991 and a full 1.0 years older than in 1981. For females, the 1992 figure was 25.4 years, compared with 25.3 years in 1991 and 24.3 in 1980.

The number of divorces also rose in 1992: 12429, compared with 10047 in 1991. This was the steepest rise since 1980. The divorce rate, which rose from 0.7 in 1981 to 1 in 1991, leaped to 1.3.

Mortality

As a result of the fall in the number of deaths, the mortality rate fell in the year from 10.5 to 10.2. This decline shows a reversal in the trend of recent years, when the rate had been rising in pace with the gradual ageing of the population.

The infant mortality rate, meanwhile fell below 10 for the first time ever, at 9.2, compared with 10.8 in 1991. The steep decline of the 1980s has more than halved the infant mortality rate, which in 1981 was still in excess of 20.

Life expectancy at birth rose to 70.8 years for males and 78.2 for females a difference between the sexes of 7.4 years.

The principal causes of death in Portugal in 1992 were, in order, cerebral-vascular disease (23.6%), no specifically identified cause (11.1%), ischemic heart disease

(9.3%), malignant tumours of the digestive tract and peritoneum (7.5%) and pulmonary disease and other forms of heart disease (7.0%).

Government measures and legislation regarding population

Portugal has no overall population policy, simply a series of measures which more or less directly influence population change. The principal policies adopted in 1992 affected international population movements. As regards emigration, the Principal Options of the Plan (Law

No 30-B/1992) set out *inter alia* the following objectives: encouraging the teaching of the Portuguese language in the Communities, defending the rights and interests of Portuguese people in the Communities; establishing conditions favourable to the reinsertion of Portuguese migrants wishing to return to Portugal for good; revitalising census measures. As for immigration by citizens of other countries, which is becoming increasingly significant, most of the provisions regulating their entry and residence in the country were revised; and the Decree Law No 211 of 12 October 1992 exceptionally legitimised the situation of non-Community citizens illegally resident in Portugal.

UNITED KINGDOM

The population of the United Kingdom was estimated to be 58 million persons at 30 June 1992. Some 20.4 per cent were aged under 16 years of age 6.7 per cent being aged under 5) ; 35.1 per cent were aged 16-39 years ; 28.7 per cent were aged 40-64 years and 11.9 per cent were aged 65-79 years. Some 3.8 per cent were aged over 80 years (2.3 per cent of males and 5.3 per cent of females). The latter figure for the very elderly compares with 1.4 per cent in 1951 and 2.3 per cent in 1971, thus illustrating the effects of higher life expectancy and reduced fertility rates (so reducing the relative number of children) on the current age structure of the population.

Some 88.4 per cent of the population lived in England and Wales, 8.8 per cent lived in Scotland and 2.8 per cent lived in Northern Ireland.

During 1992 there were 781.0 thousand live births leading to a crude birth rate of 13.5 live births per 1,000 populations. In contrast there were 634.2 thousand deaths or 10.9 deaths per 1,000 population. Thus, natural change over the year (births minus deaths) measured an increase of 146.8 thousand.

The general fertility rate (births per 1,000 women aged 15-44) was 63.4 and the total period fertility rate (TPFR) was 1.79. The TPFR, which measures the average number of children which would be borne per woman if women experienced the age specific fertility rates of the period in question throughout their child-bearing life span, has oscillated around 1.8 for over a decade, and compare with the low point in 1977 of 1.69.

In 1992, three in ten births were outside marriage, but this figure conceals a wide variation by the mothers place of births. The proportion ranged from only 1 per cent of births to mothers born in Pakistan and Bangladesh, to nearly half of all births to mothers born in the Caribbean.

The most dramatic fall in mortality have been in the death rate for under one year old, the rate having dropped by two thirds since 1961. In 1992 the infant mortality rate was 6.6 deaths per 1,000 live births. More generally, the expectation of life at birth using the 1992 mortality rates in the United Kingdom was 73.6 years for men and 79.1 years for women (this compares with 45.5 years and 49.0 years respectively at the turn of the century). Men aged 60 years could expect to live another 17.9 years, and women a further 22.1 years.

In 1992, some 11 thousand more people left the UK (227 thousand) than entered it (216 thousand), using the UN definition of long-term migration and excluding movement to and from the Republic of Ireland. (There was a small net outflow of about 4 thousand to the Irish Republic in the year ending mid-1992). Further, the above figures are likely to exclude persons seeking asylum after entering the country, and other persons admitted as short-term visitors who are subsequently granted an extension of stay for a year or longer, for example as students or on the basis of marriage. It is estimated that there were 50 thousand such persons in 1992, net of persons leaving the United Kingdom for a short-term period who stay overseas longer than originally intended.

AUSTRIA

Population

In 1992, the population of Austria increased by 48 800 (0.6%), bringing the total to 7 909 600 at the end of the year. Within just four years the population therefore rose by 307 000. The increase in 1992 resulted from an estimated net migration gain of 36 600 and a surplus of births over deaths of 12 100.

Fertility

The number of live births in 1992 rose by only 673, i.e. 0.7%, to 95 302. The total fertility rate also increased little, rising to 1.515 children per woman. Replacement level fertility stood at 0.73 in 1992. The proportion of births outside marriage grew again, amounting to a total of 25.2%.

Marriage and divorce

In 1992, the number of marriages rose by 3.6% to 45 701. The cumulated first marriages frequency rose to 58.3% for women and 53.5% for men.

The long-term increase in the number of divorces did not continue in 1992. There were 95 (0.6%) fewer than in 1991. However, this did not mean a real change in behavior patterns, but was simply due to the reduction in the number of "divorceable" marriages: the total divorce rate in relation to the marriage cohorts of previous years (total duration-specific divorce frequency) also rose slightly in 1992, with 33.66% of marriages originally contracted ending in divorce.

Mortality

The number of deaths in 1992 was slightly down compared with 1991, falling by 266 (0.3%) to 83 162. The drop was in fact even more marked because of the rise in population numbers, with the figure falling to 10.5 deaths per 1 000 inhabitants. The long-term increase in life expectancy at birth thus continued in 1992. It was 0.27 years higher than in 1991 for men and 0.17 years higher for women. In 1992, life expectancy at birth was 72.87 years for men and 79.35 years for women.

Contrary to the historical trend for the life expectancy of men and women to develop in opposite directions, in 1992 their life expectancy again became a little closer. This new trend towards convergence has been apparent in Austria for almost ten years now and has reduced the difference between the sexes from 7.2 years (1980-84) to 6.5 years.

Not only has life expectancy at birth risen, but so has the life expectancy of the elderly. A 60-year-old man can now expect to live a further 18.39 years (+0.12 years compared with 1991). A woman of the same age can expect to live a further 22.49 years (+0.16). Since the beginning of the eighties, these values have risen by 2.0 years for men and 2.1 years for women.

Infant mortality in 1992 remained at the same level as in 1991, i.e. 7.5 per thousand, thus briefly interrupting the long-term downward trend.

Migration

In 1992, net migration (an estimated 36 600 people) was significantly lower than in previous years as a result of the economic recession, but still much higher than the average for the last 30 or 40 years.

FINLAND

Population

The population of Finland grew by 26 000 persons in 1992, an increase of 0.5 per cent. This growth was mainly due to migration, as the natural increase remained similar to that noted in the late 1980s. The total population on 1 January 1993 was 5 055 000.

Marriage and divorce

The annual number of marriages has decreased steadily since 1982, the figure for 1992 being 23 000, a rate of 4.7 per 1000 - the lowest during the recorded history.

A total of 12 900 divorces were granted in 1991, which is the same as in 1991. The number of divorces increased sharply in 1988 on account of the new Marriage Act, which allowed spouses to obtain a divorce on demand after a consideration period of six months from the date of application. Since the entry into force of the new Marriage Act it has been easier to get a judgment for divorce. It is assumed that the increase in divorces is a temporary phenomenon.

The current total divorce rate suggests that over one-third of all marriages (41 %) will end up in divorce in the long run.

Fertility

The number of births in 1992 was 66 700 giving a total fertility rate of 1.85. The fertility rate has remained similar

over the last 20 years, generally varying between 1.50 and 1.80 from year to year.

Mortality

Life expectancy has increased by 7 years for males and 9 years for females since 1950, widening the difference between sexes to 8 years. The current figures in 1991 are 71.3 for males and 79.3 for females.

The number of deaths in 1992 was 49 800, almost the same as in the previous year.

Migration

The number of foreign citizens resident in Finland in the end of 1992 was 46 300, accounting for 0.9% of total population. This was a dramatic increase by comparison with previous years number of foreign citizens doubled in the 1990s.

The number of immigrants entering the country in 1992 was 14 600. The most marked change took place in immigration from the former Soviet Union in the 1990s. In 1992, the number of immigrants from the former Soviet Union amounted to 3000 persons, compared to 5500 in the previous year.

Net migration was 8 500, about 4500 less than in the previous year.

ICELAND

The population of Iceland stood at 262.386 at 31 December 1992, showing an increase over the year of 2.659 or 1,0%. In 1992 the number of live births rose by 1–2% from the previous year. External migration was turned from positive to negative.

During the past decade, since 31 December 1982, the population has grown 11,4%, or 1,08% per year. The number of children aged 0–14 years has grown 4% but their share of the total population has fallen from 26,7% to 24,9%. Population in the 15–44 years age groups has increased 13% and its share has risen from 46,0% to 46,6%, the whole increase falling on the higher age groups. The 45–64 years age groups have grown 12% and their share has remained almost constant at 17,5% and 17,4%. The oldest age groups, those 65 years old and over, have increased 21% and their share has risen from 9,9% to 10,9%. The number of the very old, 85 years and over, has grown 29% during the past decade.

Among children under 16 years of age 83,3% were in a family of two grown-ups, including 64,7% in a married couple family and 18,6% in a consensual union family, while 16,7% were living with a lone parent.

Fertility

Live births numbered 4.609 in 1992, close to the average for 1988–1992. This corresponds to 17,7 births per thousand population, which is above the crude live birth rates of 1984–87 but below the levels of every year before that. The total period fertility rate is at 2.21, 15% above the level of 1985–86.

In 1992 births to women living with the father were 88% of the total, including 43% to married women and 45% to women in consensual union at the time of birth. As for first births, 20% were to married women, 61% to women in consensual union, and 19% to other women.

Legal abortions in 1992 were about 160 per 1,000 live births.

Mortality

Deaths in 1992 numbered 1.719 or 6,6 per thousand, slightly below the five-year average for 1988–92.

For the years 1990 and 1991 combined, life expectancy is 75,1 years for men and for women 80,8 years. Life expectancy for women has remained more or less unchanged since 1983. Infant mortality rates may fluctuate from year to year due to the small size of the population. The average infant mortality rate for 1988–92 was 5,6 per thousand.

Nuptiality

The number of new marriages remains at the low level attained by 1980, at 1.241 new marriages in 1992. In 61% of these the spouses were already registered as cohabiting, while 92% state existing cohabitation to the marriage officer. The mean duration of cohabitation preceding marriage is 4,0 years for those stating cohabitation of less than 10 years. The absolute number of new marriages has declined by 35% since 1974. This conceals, however, a much more drastic reduction in age-specific marriage rates, which have fallen by over 60% since the late 1960s. The decline in marriage rates has affected all age groups equally. The mean age at first marriage has been rising in recent years, however, due to changing age composition of the population. Remarriage rates have shown considerable change in the same direction.

Concomitant with the decline in marriage rates, the registration of consensual union has increased. In 1992, about 2.600 new consensual unions were registered, while some 750 were discontinued. The number of registered consensual unions at the end of 1992 accounted for 18% of the combined number of marriages and consensual unions.

Divorce rates are fairly stable at about 10 or 11 divorces per 1,000 married women and an estimated total of 550 divorces in 1992.

Migration

Internal migration and regional population

Population growth since 1980 has, due to internal migration, occurred mostly in the Capital Region. This is apparent from the following table :

	Iceland	Capital Region		Other regions
		Reykjavík	Other	
Area (km ²)	103.000	100	770	102.130
Population as of 1 December				
1982	235 453	86 092	40 183	109 178
1987	247 357	93 425	44 516	109 416
1991	259 577	99 623	49 859	110 095
1992	262 193	100 850	50 929	110 414
Population growth, per cent per year				
1982/87	1.0	1.6	2.1	0.0
1987/92	1.2	1.5	2.7	0.2
1991/92	1.0	1.2	2.1	0.3
Share in total growth (%)				
1982/87	100.0	57.3	35.6	7.1
1987/1992	100.0	50.0	43.2	6.7
1991/92	100.0	46.9	40.9	12.2

The Capital Area, which covers less than 1% of the country, now contains 58% of the population, and has received 93% of the population growth of the last five years.

In Iceland urban population is defined as that in localities of 200 inhabitants and over. In 1992, 91,2% of the

population were in 61 urban localities while 8,8% were in rural areas.

In 1992 8.800 persons, 34 per thousand population, migrated between regions, with net migration into the Capital Region amounting to 1.300 persons. Another 8.600 persons migrated between communes within regions, and 27.400 persons moved within communes.

External migration

Historically, while there have been swift changes in the direction of external migration, Iceland is a country of net emigration. In 1992 immigration and emigration involved 2.959 and 3.213 persons, respectively, corresponding to 11,3 and 12,3 per thousand population. Icelandic citizens accounted for 67% of immigration and 55% of emigration. Net migration of Icelandic nationals was +205 and that of foreign nationals -459. Principal destinations for Icelanders moving abroad are Denmark (523 persons in 1,992), Sweden (442), Norway (245) and the United States (217).

Foreign citizens in Iceland

The number of foreign citizens was 4.826 or 1.8% of the population at the end of 1992. To a considerable extent foreign citizens in Iceland are partners in mixed Icelandic/foreign families or children thereof. In recent years, however, the immigration of single persons and families taking up work in Iceland has become increasingly prominent. Since 1982 citizens of other Nordic countries are free to work in Iceland without a permit.

The number of persons born abroad was 10.230 or 3,9% of the population. These include those born to Icelandic parents while they were temporarily studying or working abroad.

NORWAY

Population change

The population of Norway was 4.299.200 by the end of 1992. The increase on 1992 was 25.500, or 0,6 per cent, compared to 0,56 per cent the previous year. The increase in 1992 was the highest registered since 1974. Ten years ago, the increase was 0,3 per cent. The natural increase was 15.400, about 500 less than in 1991. The natural increase (+0,36 per cent) is twice the level then years ago. The unusual high population growth was a result of relative high natural increase, and high net -in-migration (+ 10.000), especially from countries in former Eastern Europe.

Fertility

The number of live births was 60100. This is a decrease from 1991 of 700 births. Thus, the fertility increase from 1983 (50.000 births) seems to have come to an end. The total fertility rate is calculated to be 1,88, 0,04 less than the previous year. From 1991, is was a significant decrease in births among women in their twenties, an a slight increase among women in their thirties. Ten years ago, the TFR reached its all time low of 1,66. Since then, there has been a substantial increase among women over 25, most prominent among women in their early thirties. Teen-age fertility is low, in 1992 16 per 1000 women.

The percentage extra-marital birth is still increasing by 2-3 percentage points yearly, reaching 43 per cent in 1992. The great majority (about 3/4) of these children are born in consensual unions. In 1993, 20 per cent of the children were born outside marriage, a small majority of those were born to cohabiting women.

The number of legally induced abortions was 15.200 in 1992, down 300 from the previous year, and the lowest number of abortions per 1000 live birth since 1973.

Marriages and divorces.

As shown in a recent survey on fertility and family, population statistics based on the population register systems do not give satisfactory representation of the total number of persons living together as couples. For persons cohabiting without being married, register-based statistics capture them only if they have common children, a small minority of them. Sample surveys show that the percentage living in cohabitational unions among women of age 20-44, has increased from 5 in 1977 to 21 in 1992.

In 1992, there was 19300 marriages contracted where at least one of the spouses was registered as resident in Norway. that is a decrease of 600 from 1991, and indicates that the general trend in marriages rates is still declining. With a smaller population at risk, the number of marriages ten years ago was 1500 higher. The cumulated first marriage frequency has been declining since the mid-seventies, and was in 1992 slightly less than 0,50. The average age at marriage for unmarried men and women increased in 1992 with 0,2 years, to 29,2 years for men and 26,6 for women. Both figures are more than two years higher than ten years ago.

The number of divorces reached 10.200 in 1992. The number of divorces per 1.000 existing marriages was 11,1. Based on the divorce rates of 1992, the percent among the married who can expect to be divorced before the age of 65, is around 45. Ten years ago, this percentage was around 32.

Mortality

The infant mortality in Norway shows a very positive trend the last few years. 5,8 per 1000 newborn babies died before reaching the age of one in 1992, down from 6,2 in 1991, and around 8,0 during the eighties. The number of cot deaths has been significantly reduced since 1989.

In 1992 there were 44.700 deaths, down 200 compared to 1991. The crude death rate was 10,4 per thousand. Life expectancy at birth was 74,2 years for males and 80,3 years for females, both are the highest figures ever registered for Norway, and an increase over 1991 of 0,2 years for both sexes. The life expectancy for almost all age groups are now higher than ever before.

In the beginning of the eighties, the life expectancy at birth was 0,9 years lower for women and 1,5 lower for men.

Migration

In 1992, there was a net immigration of 10.000, versus 8.000 the previous year. Except for 1989, there has been a net immigration to Norway for more than 20 years. A small net immigration of Norwegian citizens was due to migration with Sweden. There has been a slight increase in the net immigration from Nordic countries, a stronger increase in the net immigration from Western Europe and a substantial increase from countries in ex-Eastern Europe, from + 1.200 to + 2.500. The highest net immigration is still from third world countries, although 10 per cent down to + 4.700 in 1992. The number of asylum seekers was about 5.200, 700 more than previous year.

The most important group among them came from different parts of ex-Yugoslavia. The number of asylum seekers from all other parts of the world was declining. In 1993, there has been a dramatic increase in the in-migration of ex-Yugoslavs, mostly asylum seekers from Bosnia and Kosovo.

By the beginning of 1993, there were 154.000 persons with foreign citizenship living in Norway. About 50 per cent are Europeans, mainly from Denmark, Sweden and United Kingdom. About 30 per cent come from Asia, a large part from Pakistan. The increase in number of foreigners was citizens of republics in former Yugoslavia.

More than 5.000 foreign citizens obtained Norwegian citizenship in 1992, slightly above the average for the

period 1989-1991. A total of almost 60 per cent were from Asia, among them more than one third from Pakistan and less than one third from Viet Nam. Especially Vietnamese refugees have a high propensity to seek Norwegian citizenship as soon as they can, in 1992 50 per cent of eligible Vietnamese citizens changed to Norwegian citizenship.

Government decisions and legislation

The Norwegian government do not have any explicit population policy. There are, however, a series of measures that are related to population, and justified as social policy, welfare policy, policy for equal rights for women, immigration policy, regional policy etc. There was no major changes in such policies in 1992.

SWEDEN

Population

The population of Sweden was 8 692 013 at the end of 1992.

The development of the population in Sweden in the 1980s has been especially linked to rising fertility, small declining deaths risk and rising of immigration. While live births have increased since 1984 and the number of deaths has been relatively stable there has been a rising excess of births over deaths. But in 1991 the number of live births began to decline and the number of deaths was stable which made the natural increase smaller in 1991 than in 1990. In 1992 there has been the same trend as in 1991. In 1992 the natural increase was 28 138 persons. Compared with the natural increase in 1991 there was a smaller decline in 1992.

In the period 1982-1989 the net migration increased. The increase of the net migration depended on rising immigration and relative stable emigration. At the end of 1989 the government in Sweden took a decision that further limited the immigration and in 1990 the net migration began to decline. In 1989 Sweden had the highest figure of net migration (44 400 persons) since 1970. The net migration in 1992 was 19 600 persons which was 5 400 persons less than in 1991.

The total increase of the population in Sweden was during 1981-1983 the lowest in the last century. In 1983 the population increased with 2 900 persons. But between 1984-1989 the population rose every year. In 1989 the total increase was 68 100 persons. The limits in the immigration made the total population increase decline in 1990, 1991 and 1992. The increase in 1991 was 53 500 persons and in 1992 there was an increase of 47 700 persons.

The population is predicted to increase to 9 010 000 persons at the end of the year 2000 and to 9 580 000 persons at the end of the year 2025. The future population will be an old one. At the turn of the century, 16.9 per cent of the population will be older than 64 years of age and 5.0 per cent older than 79 years of age. In the former age-group this is a decline compared with the present proportion but an increase in the latter age-group. In 2015 the proportions will increase to 19.8 and 4.9 per cent respectively.

Fertility

In the last fifty years Sweden has had three periods of high fertility: the middle of the forties, the middle of the sixties and the beginning of the nineties. In 1983 there was an extremely low number of live births in Sweden, 91 800 children. But in the period 1984-1990 the number of live births increased. In 1990 there was 123 900 live births. In 1991 the live births declined to 123 700 and in 1992 there was 123 800 live births.

At the beginning of the century about every tenth live birth had an unmarried mother. The situation was about the same until 1960. During the sixties another pattern began to appear. It became more common to live together without marriage. In 1970 nearly 20 per cent of all live births were extra-marital births. The corresponding figure for 1980 was nearly 40 per cent, for 1991 48 per cent and in 1992 a small increase to 49,5 per cent. The highest rate of extra-marital births was in 1989 with nearly 52 per cent.

In the beginning of the eighties the total fertility rate (TFR) in Sweden was very low. In 1983 the TFR was only 1,61 child per woman. Since 1984 the TFR has increased. The highest TFR was reported in 1990 and in 1991 (2,1 child per woman). In 1992 the TFR reached 2,09 child per woman which meant nearly full reproduction. The fertility in Sweden is at present one of the highest in Europe.

Marriages and divorces

The lowest number of marriages in the last fifty years was in 1983 with 36 200 marriages. The highest number in the same period was in 1989 with 109 000 marriages. The marriage-boom of 1989 was concentrated towards the end of the year. Changes in the rules for future pensions to widows could explain most of the increase. During 1991 and 1992 the number of marriages declined to a more normal level, 36 800 and 37 200 respectively.

The average marriage age for unmarried men and women in 1992 was 30,7 years of age for men and 27,8 years of age for women. The average marriage age has increased in the 1980's both for men and women. The highest age was in 1989, 33,7 years for men and 31,0 years for women, when Sweden had the marriage-boom and it was many middle-age people who married.

In the eighties the number of divorces were relatively stable around 18 000 to 20 000 divorces each year except in 1988 when there were 17 700 divorces. After 1988 the number of divorces increased slightly. In 1991 there was 20 100 divorces and in 1992 21 900 divorces.

Mortality

In the mid-18th century every fifth child never survived its first year. In Sweden today death before the age of one is rare. Only five of 1 000 live born children die during their first year and half of these deaths occur in the first week of their life. Boys have a slightly higher infant mortality rate than girls.

Life expectancy for a new-born female is at present about 80 years, about six years longer than for males. The change over the past decade is 1,7 year for men and 1,8 year for women. For men this is the largest increase since the 1950's. Since the beginning of this century until

1980's males have improved their life expectancy at birth with nearly 22 years and females with 25 years.

More than half of all deaths are due to some disease in the circulatory system. This has been the most common cause of death since early 1920's. The second most common cause is cancer.

Among boys and young men physical injuries account for the majority of deaths. Among the elderly it is above all the diseases of the circulatory organs and tumours that lead to death. Tumours are a more common cause of death among middle-age women than among men. Death caused by physical injury is very rare among girls and young women.

Government decisions and legislation.

There are no such decisions or legislation.

SWITZERLAND

Population

The population permanently resident in Switzerland increased by 1 % (70 800) in 1992, to total 6 904 600 on 31 December 1992. The rate of increase in the previous year was 1,2 %. The demographic increase results from an excess of births over deaths of 24 608 (34,8 %) and from a net inward migration of about 46 192 persons (65,2 %). In 1991 the corresponding figures amount to a 23 600 (28,4 %) excess of births over deaths and to a net inward migration of about 59 500 persons (71,6 %).

The number of children and young people (under the age of 20) increased by 18 600. In 1970 young people still accounted for 31 % (1,9 million) of the permanently resident population ; by the beginning of 1993, they accounted for only 23,4 % (1,61 million).

The number of people of working age (between the ages of 20 and 64) increased by 1,0 % (42 800).

The number of retired people again increased by 10 600 (1,1 %) relative to the previous year. This rate of increase is below the average annual rate of increase recorded between 1971 and 1987. At the beginning of 1993, there were 1 007 400 people aged 65 or over.

On basis of the population data for 1991 the Swiss Statistical Office has prepared for the second time since 1986 population projections, which include the years 1991 to 2040. Six scenarios have been calculated under the assumptions of different population trends partly correlated with developments of the Swiss policy regarding the European integration. According to the most likely variants the results indicate a population growth of 400 000 to 550 000 people within the next 10 years and 550 000 to 1 million by the year 2020. In the long run, however, all variants lead to a decrease in population. The proportion of foreigners increase to 21,9 % in 2010, but will drop to around 16 %. Population growth occurs mainly in the age group 50 years and over. The dependency ratio climbs by 20 % to 25 % within the given time period. By the year 2030 deaths will slightly exceed births.

Marriage and divorce

Marriage

In 1992 there were 45 080 marriages, representing a decrease o 5,3 % relative to the previous year. The

marriage rate decreased in 1992 to 6,5 marriages per thousand average population (7 in 1991).

The increase in the number of marriages in 1991 was due mainly to marriages between Swiss nationals and female foreign nationals. The change in Article 27 of the Nationality Law, which relates to the acquisition of Swiss nationality through marriage, induced a large number of Swiss nationals to legalise their relationship with foreign nationals before the change came into effect. Since January 1 1992 female foreign nationals are equal in law to male foreign nationals, i.e. they don't acquire Swiss nationality through marriage automatically. In 1991 marriages between Swiss nationals and foreign nationals accounted for 27,4 %, whereas in 1992 they accounted for only 23,3 % (1990: 23 %). The total number of marriages between Swiss nationals reached 29 334 in 1992, representing a slight decrease of 2,1 % relative to 1991. The number of marriages between foreigners has steadily increased over the years and comes to a proportion of 11,6 % in 1992 (1991: 9,7 %).

Divorces

In 1992 there were 14 530 divorces, representing an increase of 6,2 % relative to the previous year; the crude divorce rate was about two divorces per thousand population. The total period divorce rate is increasing over the years and reached approximately 36 % in 1992.

Fertility

In 1992 there were 86 910 live births, 0,8 % (710) more than in the previous year; this has been the lowest increase since 1987. The proportion of foreigners calculated on the basis of all live births amounted to 23,3 % (1991: 22 %). As in 1991, the increase was due entirely to the birth of children of foreign nationality. The foreign births continued to increase above average. While the total number of foreign births was 8,9 % higher than in 1991, the births of Swiss nationals decreased by 1,5 % in the same period. With regard to the excess of births over deaths the proportion of foreigners climbed from 64% in 1991 to 68 % in 1992. The total period fertility rate was 1,6. The proportion of children born to unmarried mothers, which passed the 6 % mark for the first time in 1988, was 6,2 % in 1992. The value indicates a slight decrease compared to 6,5 % in 1991.

Mortality

In 1992 there were 62 303 deaths, 332 less than the number recorded in the previous year; the decline con-

tinued, since the major influenza epidemic occurring in the winter of 1989/1990, which accounted for some 900 deaths and led to a higher mortality rate (9,5). In 1992 the crude mortality rate was about 9,0 per thousand population (9,2 in 1991).

In 1992, 557 children died in their first year of life; the infant mortality rate (6,4 deaths for 1 000 live births) was above the 1991 figure (6,2).

Life expectancy continues to increase, a phenomenon already observed in the 1970s and 1980s. During the period 1990/1991 there was a slight increase in the case of women with 80,9 years (1989/1990: 80,8 years) as well as in the case of men (74,1 years) (1989/90: 74,0 years).

Migration

International migration of Swiss nationals

On average, approximately 30 000 Swiss nationals emigrate each year. The number of Swiss returning to the country is a little higher. Within these migratory movements, the percentage of women slightly exceeds that of men. In 1992, women accounted for 55 % of Swiss nationals returning and 51 % of those emigrating.

More than half of the Swiss national returning to Switzerland and of those emigrating are between 20 and 34 years of age. Among those under the age of 45, the first group are more numerous, while among those over 45, emigrants are generally in the majority.

International migration of foreign nationals

A special feature of Switzerland is that it attracts a large number of foreign nationals. However, the immigration

of foreign nationals is subject of the laws relating to aliens and the right of asylum. Also, it is limited by Federal Council policy which seeks to stabilise the number of foreigners resident in Switzerland and to promote their integration. Annual variations in the number of immigrants and emigrants are largely linked to the labour market situation.

Since 1979, the total number of persons holding annual residence permits or "permis d'établissement" (giving more extended rights of residence) and employees of international organisations entering the country has exceeded the number of those leaving. Apart from 1982, 1983 and 1992 net inward migration has risen continuously, reaching a level of 57,700 in 1991. In 1992 net inward migration dropped to 44 700. The number of migrants returning to their own countries remains on a high level. For every thousand immigrants, 627 people returned to their own countries in 1992. The international mobility rate for foreigners in 1992 was 176 per thousand, i.e. approximately 15 times higher than the rate for Swiss nationals.

In addition to the migration of categories of foreigners who form part of the permanently resident population, account should be taken of the migration of seasonal workers and asylum-seekers and also of frontier workers.

Each year approximately 130 000 seasonal workers enter Switzerland and normally leave within nine months. In 1992, the average number at any one time was 62 600.

The number of asylum-seekers with applications pending in Switzerland is decreasing. At the end of 1992, there were 47 800, 23% less than in the previous year. The majority of asylum-seekers are of Sri Lankan (53%), former Yugoslav Republics (19%) or Turkish (9%) origin.

European Commission

Demographic statistics 1994

Luxembourg: Office for Official Publications of the European Communities

1994 — XVI, 256 pp. — 21.0 x 29.7 cm

Theme 3: Population and social conditions (yellow covers)

Series A: Yearbooks

ISBN 92-826-8116-5

Price (excluding VAT) in Luxembourg: ECU 20

While all member countries possess highly developed systems of demographic statistics, the wide diversity of practice with regard to the publication and presentation of results makes it very difficult to obtain comparable and up-to-date information necessary to study trends within the Community. The present publication is designed to make good this deficiency. All the principal series of demographic statistics are covered, namely population by sex and age-group, births, deaths, migration, marriages, divorces, fertility, life expectancy and population projections. Both absolute numbers and rates are given in considerable detail for each country and for the total Community.
