### *May-June 1995 cattle population survey*

#### **Cattle population declines slightly Estimated beef and veal production increases**

According to the provisional results of the survey of stockbreeders conducted at the end of spring every year, at 86.5 million head, the total cattle population in the fifteen-member EU was down by some 300 000 on the previous year. The previous count, carried out in December 1994, on the other hand, indicated a slight increase of some 200 000 head. These minor fluctuations of less than 0.5% in either direction show that herd numbers are still holding stable and that the cyclical increase in production has still to become general. Judging by the composition of the herd and recent developments in slaughterings, beef and veal production in the European Union in 1995 should rise by some 2.5% on 1994. This increase could slow down in 1996.

Cattle for fattening (around 30% of the total herd) account for the bulk of the slight decline in population. Beef calves, young bulls and heifers for slaughter all show declining numbers. On the other hand, the breeding herd is holding stable, and breeding heifer numbers are up on last year.

Beef calf herds have considerably declined in the three large producer countries (France, Netherlands and Italy). The reduction is particularly marked in France, with 170 000 head fewer than in June 1994. This decline, already observed in the December 1994 survey, has become much more marked since. As beef calf production is intensive, predominantly carried out in fattening houses and over short periods, it reacts quickly to short-term developments.

The number of young males for fattening is down 2.3% on average. The fall in population, which essentially affects the north of the European Union, is drastic in some countries such as Denmark and the Netherlands, where it is in excess of 15%. Populations of heifers for slaughter are declining in virtually all the main producer countries (France, Ireland, Italy and Germany). For the Union as a whole, numbers have declined by around 5%.

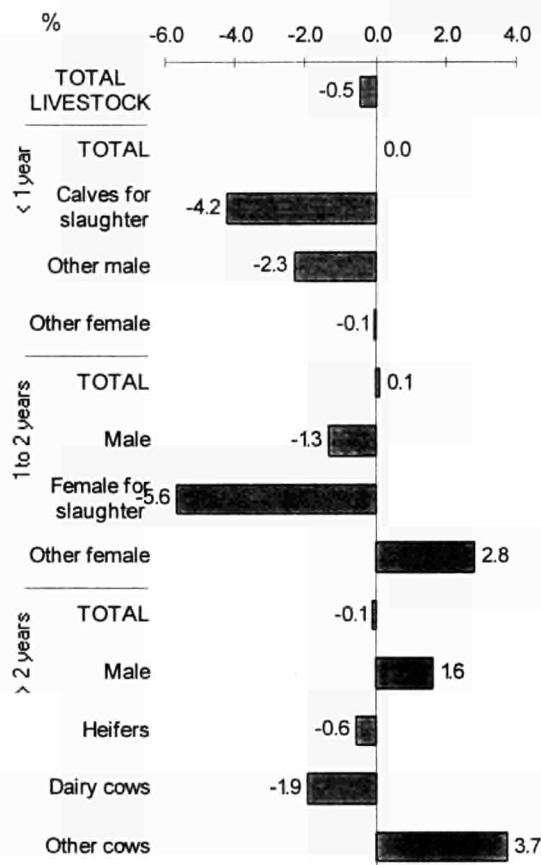

These decreases are partly linked to the fall in demand from Italy. The devaluation of the lira has slowed down the traditional flow of exports to this country, which imports large amounts of beef and veal.

#### 400 000 more suckler cows

The breeding herd and replacement heifers present more optimistic prospects. The downward trend in the dairy cattle population - the necessary counterpart to the increase in

milk yield under the quotas system - is almost entirely offset by the increase in the suckler cow herd. In all, there are 410 000 more suckler cows than one year ago and 430 000 fewer dairy cattle.

The new Member States deserve particular attention in this regard. In order to comply with its allocated milk quotas, Austria has considerably reduced its dairy herd and turned resolutely to breeding sucklers. Finland and Sweden, with the benefit of the transitional phase, will adapt their herd numbers and production in the coming months.

#### Dairy and suckler cow population in EUR15 in May-June 1995

Thousand head

#### From country to country

Analysing the changes in cattle herds in individual countries, the reductions in Denmark and Italy are particularly striking (5.4% and 4.3% respectively). In most other Member States, herds have remained stable overall. Only Spain and Luxembourg stand out, with increases of more than 2%. Both show marked increases in suckler cow numbers. It is worth noting that suckler cows have outnumbered dairy cattle in Spain since 1994. Spain is still an exception in this regard, but it will probably be joined by France in the relatively near future.

Germany, where the move from dairy cattle to suckler cows has hitherto been in scant evidence, has growing suckler and dairy

herds with more than 100 000 head in all and a corresponding increase in all breeding stock. This development, observed in both the old and the new Länder, marks a break with a period of several years' marked reduction in stocks. In the United Kingdom, the changes in milk marketing management produced a short-term increase in dairy cattle numbers in 1994, and from that point of view the heavy reduction in 1995 constitutes a return to normal.

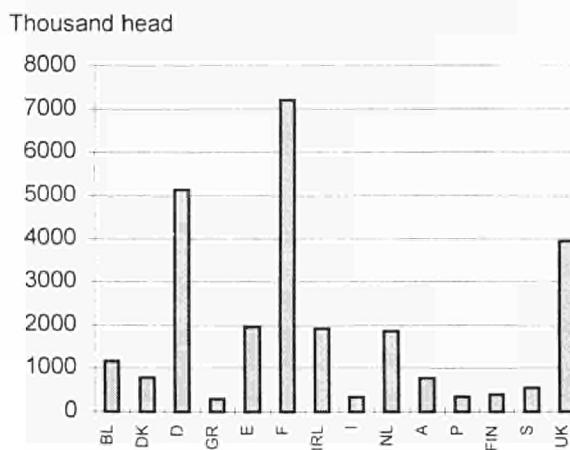

### Gross Indiginous production of cattle: 95/94 +0.5% increase in head +2.5% increase in weight

Gross indigenous production for the EU in 1995 is estimated at 29.7 million head for all categories, which is about 0.5% up on 1994. The increase will be greatest in adult stock (1.2%), while calf numbers should decline by around 1%. Carcass weight should increase by some 3.5 kg., judging by slaughtering in the first half of the year. Beef and veal production in the EU may be expected to rise by some 2.5% by weight year-on-year. The meat production forecasts for 1996 are less optimistic: a reduction of 0.6% in slaughterings, pointing to a moderate increase in weight due to heavier carcasses.

It should be stressed, however, that the change is far from typical of the European Union as a whole. In 1995, production was largely driven by large-scale slaughtering of adult cattle in the United Kingdom, Ireland and

Spain. In the United Kingdom, most of the animals involved were cull cows, whose slaughter should taper out in the near future. In Ireland, they were primarily fattening stock and, in view of the current stocks, the process should be more lasting. Spain has redeveloped its stocks in the last two years and is currently in full production. A production increase of +7.5% by head is to be expected for 1995 compared with 1994, followed by a further increase of 1.4% in 1996.

**Change in Carcass weight  
of adult cattle in EUR12**

\*Forecast based on first months of the year

**Veal production should decline further in France**

In France, production of adult cattle is forecast to increase by 2% by head in 1995 and again in 1996. Calf production, on the other hand, should continue to decline. Italy continued to cut back its stocks this year, which boosted slaughter rates in the short term but will push production down in the medium term. In Germany, stock numbers are rising and production is stabilising.

Countries forecasting declining GIP for cattle up to the end of 1996 include the Netherlands, where slaughter rates should decline in every category, but one newcomer, Austria, will have to adapt its production to its new environment.-

With an upward trend in beef and veal production, experts are counting on a recovery in consumption after the decline in 1994. The

slump recorded in Germany last year should not continue, and beef could get the edge on the competition because pork prices have held firm hitherto while beef prices have fallen.

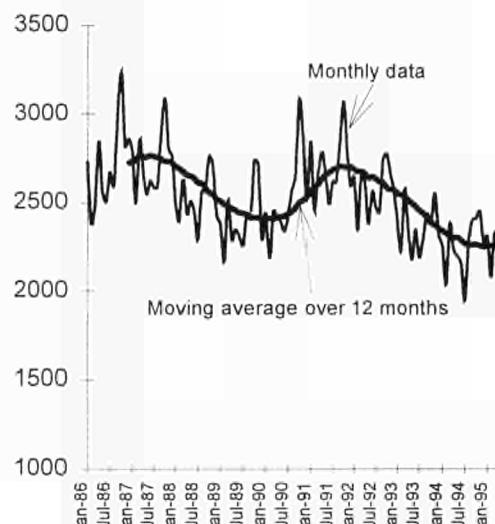

### No more intervention stocks

This fall in prices has come at a time when the beef and veal market is in equilibrium, as attested by the virtual lack of intervention stocks.
