

INDUSTRIAL SHORT-TERM TRENDS

Monthly

INDEX OF INDUSTRIAL PRODUCTION

Growth in Community industrial production of 4.5% in 1979

The seasonally adjusted index of industrial production for the European Community reached the level of 121.0 (1975 = 100) in December 1979, a rise of 1.8% over the figure recorded in the previous month. This strong increase – the largest since February 1979 – was due primarily to a sharp rise in end-year industrial production in Germany, and, to a lesser extent in France. These developments have strongly influenced the short-term rate of growth of the EUR-9 index, which, after falling from 2.0% in the second quarter to 0.6% in the third, increased again in the fourth quarter to register a rise of 1.2%. Trends in the Community's investment and consumer goods industries have matched those in the total index over the last three quarters, but cyclical movements have been more pronounced in the investment goods sector. In the intermediate goods industries, however, the trend rate of growth has fallen steadily in the last two quarters to below the rates of change registered in the overall index.

Turning to the latest developments in the unadjusted index, the December returns show that Community industrial production attained the level of 123.4 (1975 = 100), a rise of 4.3% over the corresponding month of the previous year. This rate of growth follows rises of 3.0% and 3.9% recorded in October and November on the same basis of calculation and provides additional evidence in support of the hypothesis that economic activity held up quite well in the fourth quarter of 1979. Overall, the index of industrial production increased by 4.5% in 1979 over the previous year, against rises of 2.2% and 2.4% registered in 1977 and 1978 respectively. All the major product regroupments showed improved results against those recorded in 1978, but the upturn was particularly marked in the intermediate goods sector (growth up from 3.0% in 1978 to 5.9% in 1979) and in the investment goods sector (growth up from 0.2% in 1978 to 3.0% in 1979).

Looking at the growth rates in the index of industrial production for the Community and for the member states over the last three decades (see table 2), it is important to observe that in all cases growth declined during the 1970's from the fast rates recorded during the previous twenty years. The extent to which this deceleration in growth occurred varied considerably from country to country, but the overall effect on the composite Community index was to halve its rate of expansion between the 1960's and 1970's. For the decade just passed the downturn in the level of economic activity in 1975 had a significant negative impact on average rates of growth although since this year production has recovered and rates have returned towards, and in some cases exceeded, their long term average levels. Against this background the results for 1979 can be viewed in favourable terms.
