<p>Press releases: Eurostat publishes around 100 press releases every year in connection with the release of new data. The press releases include the key figures on the EU, the Member States and their partners. They are provided free of charge. They are also available on the Internet as soon as they are published: www.europa.eu.int/comm/eurostat/</p>					Paper Html PDF
<p>Statistics in focus: This collection is published regularly by Eurostat and provides up-to-date summaries of the main results of statistical surveys, studies and analyses. It covers all themes and consists of about four to eight pages per issue. Eurostat issues around 150 <i>Statistics in Focus</i> per year. Available as single copies or on subscription.</p>					Paper PDF
<p>Key indicators: This collection provides the main indicators on a theme or sub-theme in an easy-to-carry booklet of up to 100 pages. Available as single copies or on subscription.</p>					Paper Html
<p>Panorama of the European Union: This collection highlights the features and trends of a multi-sectoral theme or a sectoral sub-theme. The publications consist of around 200 pages and include analysis as well as tables and graphs. Available as single copies or on subscription.</p>					Paper CD-ROM
<p>Methods and nomenclatures are intended for specialists who want to consult the methodologies and nomenclatures used for a theme, a sub-theme or a sector. Available as single copies.</p>					Paper CD-ROM
<p>Detailed tables are intended for specialists. They present part, or all, of the statistical data compiled on a theme, sub-theme or sector. Available as single copies or on subscription.</p>					Paper CD-ROM
<p>Studies and research summarise the results of European statistical studies and research and are intended for specialists. Available as single copies or on subscription.</p>					Paper CD-ROM
<p>Catalogues provide rapid access to concise information on Eurostat's products and services. They are free of charge and include the <i>Mini guide</i>, a selection of Eurostat products and services, and <i>Statistical references</i>, the quarterly newsletter on Eurostat's latest products and services.</p>					Paper

..... Immediate access to harmonised statistical data

Eurostat Data Shops:

A personalised data retrieval service

In order to provide the greatest possible number of people with access to high-quality statistical information, Eurostat has developed an extensive network of Data Shops (*).

Data Shops provide a wide range of **tailor-made services**:

- ★ immediate information searches undertaken by a team of experts in European statistics;
- ★ rapid and personalised response that takes account of the specified search requirements and intended use;
- ★ a choice of data carrier depending on the type of information required.

Information can be requested by phone, mail, fax or e-mail.

(* See list of Eurostat Data Shops at the end of the publication.

Internet:

Essentials on Community statistical news

- ★ Euro indicators: more than 100 indicators on the euro-zone; harmonised, comparable, and free of charge;
- ★ About Eurostat: what it does and how it works;
- ★ Products and databases: a detailed description of what Eurostat has to offer;
- ★ Indicators on the European Union: convergence criteria; euro yield curve and further main indicators on the European Union at your disposal;
- ★ Press releases: direct access to all Eurostat press releases.

For further information, visit us on the Internet at: www.europa.eu.int/comm/eurostat/

A great deal of additional information on the European Union is available on the Internet. It can be accessed through the Europa server (<http://europa.eu.int>).

Cataloguing data can be found at the end of this publication.

Eurostat is the Statistical Office of the European Communities. Its task is to provide the European Union with statistics at a European level, that allow comparisons to be made between countries and regions. Eurostat consolidates and harmonizes the data collected by the Member States.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of the information, Eurostat has set up a publications and services programme.

This programme makes a clear distinction between general and specialist users and particular collections have been developed for these different groups. The collections *Press releases*, *Statistics in focus*, *Panorama of the European Union*, *Key indicators* and *Catalogues* are aimed at general users. They give immediate key information through analyses, tables, graphs and maps.

The collections *Methods and nomenclatures*, *Detailed tables* and *Studies and research* suit the needs of the specialist who is prepared to spend more time analysing and using very detailed information and tables.

All Eurostat products are disseminated through the Data Shop network or the sales agents of the Office for Official Publications of the European Communities. Data Shops are available in 12 of the 15 Member States as well as in Switzerland, Norway and the United States. They provide a wide range of services from simple database extracts to tailor-made investigations. The information is provided on paper and/or in electronic form via e-mail, on diskette or CD-ROM.

As part of the new programme Eurostat has developed its website. It includes a broad range of on-line information on Eurostat products and services, newsletters, catalogues, on-line publications as well as indicators on the euro-zone.

Yves Franchet
Director-General

PREFACE

*T*he European Community Farm Structure Surveys (FSS) provide a continuous record of the changes in the structure of individual farms since 1966/67. The topics covered in these surveys have remained remarkable constant over the years even if specific questions have been added or changed to reflect changing realities. They provide a picture of the situation in each EU Member States on average every third year. As fresh countries have joined the EU each has carried out the FSS at the earliest opportunity. The importance of the FSS is illustrated by the fact that they are one of the very few Community statistical surveys for which there is a continuing community financial contribution.

The present volume draws on the rich information provided by this series of community surveys to give an overview of changes in farming over the last 3 decades. It is the fruit of collaboration not only between different Commission services : from Eurostat those directly responsible for the FSS as well as other agricultural statisticians, and from the Directorate General for Agriculture but also with agricultural statisticians in the Member States whom we thank here for their through checking work. A feature is the copious use of maps and diagrams as well as analytical comments to each of the main sections, comments which also draw partly on other community agricultural statistics (on current production). In parallel with the preparation of this volume has been issued a series of matching "Statistics in focus", short reports each on some specific aspect of structural change of which the present publication can be seen as both a consolidation and a more complete presentation.

INTRODUCTION

To enable the agricultural situation in the Community to be assessed and trends in the structure of agricultural holdings to be monitored, comparable data are required for all Member States. To this end, statistical surveys are carried out at regular intervals (every two or three years) of those agricultural holdings which are "sufficiently large", i.e. which have a utilised agricultural area of a certain size or produce marketable products on a certain scale or whose production exceeds certain natural thresholds.

The statistical services of the Member States carried out Community surveys on the structure of agricultural holdings (Farm Structure Surveys) in 1966/67, 1970/71, 1975, 1977, 1979/1980, 1983, 1985, 1987, 1989/90, 1993, 1995 and 1997. The data from the 1977 survey are not included in this publication.

The next Community survey will be in 1999-2000 and will involve the 15 Member States of the European Union as well as many neighbouring countries, whether applying to join the Union or not.

This publication is intended to give the reader a picture of changes in the structure of agricultural holdings, in terms of land use, livestock, the labour force and types of farming.

The general methodology of surveys prior to 1989/90 was published in May 1986 and the methodology for the 1989/90 and 1993 surveys in 1996. A publication on the methodology used for subsequent surveys is in preparation. Reference should be made to these publications for any detailed questions on methodology aspects.

When the results of the Farm Structure Surveys are used, it should be noted that the results for some characteristics and some countries may differ significantly from those obtained from other sources.

There may also be fairly substantial variations from one survey year to the next. These results are explained to some extent by the choice of stratification variables, which change according to the survey objectives. In particular, the Farm Structure Surveys have used multi-purpose samples in some cases. Another reason is small sample size, especially in cases where characteristics are relatively uncommon or apply specifically to specialised holdings. Needless to say, everything possible has been done to make the results accurate.

The tables thus give a reliable picture of the structure of holdings in the Community. The figures in this publication should not be taken as absolute values, but as information illustrating trends in the structure of agricultural holdings throughout the years.

The data in the tables and figures are taken from the Farm Structure Survey. Some of the comments are based on other Eurostat data, including those in the database on agricultural production.

Farm Structure Surveys are based on Commission Regulation 571/88, the Annex to which lists the characteristics covered. Their code is shown in the tables wherever possible and given on pages 18 and 19.

ADDITIONAL INFORMATION

The main results of the Community Farm Structure Surveys are published by the Statistical Office of the European Communities (Theme 5, Series C). At irregular intervals, the Statistical Office publishes "special" reports on specific aspects of the Community's agricultural structure.

More information on these results can be obtained from the following address:

Eurostat F 1,
Bât. BECH, C2/604,
Rue Weicker 5,

ROUNDING ERRORS

In general, results are rounded for every cell individually (data being tabular) including the total cell. Hence the total cell may not correspond exactly to the sum of the different component cells.

1 HISTORICAL BACKGROUND

The first survey on the structure of agricultural holdings (Farm Structure Survey) was in 1966/67 in the six Member States of the EEC - Belgium, Germany, France, Italy, Luxembourg and the Netherlands - and consisted of a random sample survey of 1.2 million holdings. The Member States received a contribution from the European Agricultural Guidance and Guarantee Fund (EAGGF) towards the expenditure incurred.

In 1970/71, on the occasion of the general agricultural census recommended by the *Food and Agriculture Organisation*, the FAO, the Member States were asked to provide information on a series of characteristics which could be used to produce a Community schedule of tables. Most of the Member States calculated their results on the basis of a full-scale survey; only France provided tabular results based on a sample. The information in the tabular programme corresponded in part to that used for the 1966/67 survey. No contribution was made to costs.

The 1975 survey was generally conducted on the lines of the 1966/67 survey. The list of characteristics, the definitions and the scope were the same as far as possible. The survey was carried out in the nine Member States, with a sample covering around 900 000 holdings. Member States conducting a full-scale survey could, if they wished, supply results in the form of tables; Belgium and the Netherlands did so. The individual data for the other Member States were sent to Eurostat in a non-identifiable form and Eurostat prepared the tabular results. A contribution was made to the cost of providing the Commission with this information.

In accordance with the FAO's recommendation on a world agricultural census, the 1979/80 Farm Structure Survey was carried out as a general census (full-scale survey) of all agricultural holdings. Nevertheless, the Member States were able to survey some of the characteristics in the list by means of sampling; the United Kingdom did so for the labour force and machinery. With the exception of Germany and Ireland, all the Member States transmitted tabular results on the basis of a full-scale survey.

In 1989/90, a general census (full-scale survey) of all agricultural holdings was held, following the FAO's recommendation on a world-wide agricultural census. For certain characteristics, however, the Member States could survey by sampling, and they were also able to carry out the survey up to twelve months before or after the due date. In this latter case, they had to carry out a sample survey in addition to the basic survey, referring to the 1989 or 1990 crop year.

Four Member States - Germany (1989), Greece (1989), France (1990) and Ireland (1989) - made use of this possibility. Results were calculated at Member State, regional and district survey levels. The additional sample survey provided results at Member State and regional levels only.

Since the 1989/1990 structure survey, the Member States (with the exception of Germany) have sent Eurostat individual data per holding instead of tabular results. Germany has sent Eurostat tabular results only.

Eurostat guarantees that individual data sent by the Member States will be used for statistical purposes only; they will in no case be used for administrative purposes.

The individual data are used to produce the tables in the EuroFarm tabular data bank (TDB/BDT), which contains standard tables.

2 COMMENTARY ON THE HISTORICAL RESULTS OF THE SURVEYS

This section summarises the results of the Farm Structure Surveys since 1966-1967. Most of the rules governing the surveys have been defined in official Community texts and thus the published data are comparable over time and space as far as possible.

The main exceptions to the Community methodology are set out below.

2.1 1970-1971 survey:

National definitions differing from Community definitions

2.1.1 Belgium

(Census in May and December 1970)

Survey period: The majority of the data, including the labour force working on the survey date, were collected on 15 May 1970. The other data, in particular the labour force working during the previous twelve months and the use of machinery, were collected on 1 December 1970.

Holder and members of holder's family: Where the holder is a legal person or does not work on the holding as a natural person, the salaried manager is regarded as the holder, and the members of this manager's family are regarded as members of the holder's family.

Full time labour force: Persons working at least 90% of annual working time (= 300 days at 8 hours a day). This gives a total of 2 160 hours, i.e. slightly less than the 2 200 hours laid down in the Directive.

2.1.2 Federal Republic of Germany:

(Survey carried out between May 1971 and February 1973)

Survey period: Results covering legal form, land use and animal production come from the basic agriculture and forestry survey carried out in 1971, whilst most of the other results come from the full-scale survey or, in certain cases, the sample survey carried out between January and March 1972. Some of the results on fruit-growing, vineyards and crops grown under glass are taken from the horticultural survey of December 1972 and January 1973 or the vineyard survey carried out between December 1972 and February 1973.

Scope of the survey: The various surveys carried out for the national agricultural census of 1971 make a basic distinction between "agricultural holdings" and "woodland holdings", based on production. In the latter holdings, the wooded area is over ten times larger than the UAA. Only "agricultural holdings" have been taken into account for the Community programme: "woodland holdings" (some 2 100) with a UAA of 1 ha or more or with a minimum of production units are excluded. However, these woodland holdings were included in the results of the 1966-1967 survey (but not in 1975 and 1977). The threshold (10 ares) required for inclusion in the national horticultural and vineyard surveys for 1972-1973 was lower than that fixed for the 1971-1972 agricultural census (50 ares for fruit-growing and 30 ares for vineyards).

2.1.3 France
(Survey carried out between 1 September 1970 and 1 April 1971)

Breeding sows: No weight limit was applied. Data on breeding sows may therefore include animals weighing less than 50 kg.

Holders and members of the holder's family: Where the holder is a legal person or does not work on the holding as a natural person, the salaried manager is regarded as the holder, and the members of this manager's family are regarded as members of the holder's family.

2.1.4 Italy
(Survey carried out in October 1970)

Arable land: this heading now includes kitchen gardens.

Holder and members of holder's family: Where the holder is a legal person or does not work on the holding as a natural person, the salaried manager is regarded as the holder, and the members of this manager's family are regarded as members of the holder's family.

2.1.5 Luxembourg

Holder and members of holder's family: Where the holder is a legal person or does not work on the holding as a natural person, the salaried manager is regarded as the holder, and the members of this manager's family are regarded as members of the holder's family.

2.1.6 Pays-Bas
(May 1970 census)

Scope of the survey: As from 1970, the lower limit for inclusion was 10 SHU (standard holding units), regardless of the area, and thus comparability with the results of the 1966-1967 survey is limited, particularly in the "*Under 5 ha*" and "*Total holdings*" classes.

2.2 1979-1980 survey

2.2.1 Italy

No Community survey was carried out in Italy in 1979/80 or 1983. The results published for these two years are based on a sample of 10% of the questionnaire from the 1982 agricultural census.

In the tables, a dash links the values allocated for 1979/80 and 1983.

2.2.2 Portugal

The results are taken from the 1979 continental census (i.e. they exclude the Azores and Madeira). This differed from the Community survey mainly in the following respects:

- the total area of woodland (approximately 400 000 ha) was included under both *woodland* and *arable land* or *permanent pasture*;
- the same rule was applied to temporary crops, which were also included under *permanent crops* (approximately 170 000 ha). Thus some 6% of the UAA is counted twice, but the UAA itself is correct;
- very large cooperatives were treated in the same way as other holdings, i.e. the members of the cooperative are regarded as permanent full-time salaried managers and the areas, generally let by the State, come under the heading of "*tenant farming*";
- since no distinction is made between *quality wines* and other wines, all the data have been included under *other wines*.

2.3 1983 survey

2.3.1 Denmark

After the 1979-1980 survey, the threshold for inclusion in the survey was raised from 0.5 ha to 5 ha, thus excluding for 1983 some 10 000 holdings in 1983. However, these holdings account for a mere 0.5% of total agricultural production.

Only 60% of holders replied to the questions on their working time and that of their spouse. The tables were therefore extrapolated from the replies received. In the interests of consistency between the data on the work time of the holder and the other labour force data, the latter were limited to the 60% of holdings which replied to the questions on the working time of the holder. Thus, the workforce data are relatively unreliable.

It was assumed that *other members of the holder's family* and the *non-family labour regularly employed* (L/03) and (L/04) work full time (this would appear from other sources to be true in 85% of cases).

2.3.2 France

Since 1983, if the manager works on behalf of another legal or natural person (1.4% of holdings in 1983), the members of his family who work on the holding are regarded as non-family labour regularly employed. Thus the results of surveys prior to 1983 are not comparable with those of later surveys as far as the *family workers* and *non-family labour regularly employed* are concerned.

2.3.3 Italy

No Community survey was carried out in Italy in 1979/80 or 1983. The results published for these two years are based on a sample of 10% of the questionnaire from the 1982 agricultural census.

In the tables, a line links the values allocated for 1979/80 and 1983

2.3.4 United Kingdom

The data on the number of spouses are not reliable in the case of Northern Ireland, and this affects the labour force data for the United Kingdom.

2.4 1985 survey

2.4.1 Change in the typology of agricultural holdings

Cf. page 15, classification of a major share of agricultural holdings not hitherto classified in Ireland and United Kingdom under *various grazing livestock - no dominant enterprise* (type of farming 444).

2.4.2 Denmark

There were 9 300 agricultural holdings of 0.5 to 5 ha UAA with under ECU 3 000 SGM.

The data on the working time of holders and their spouses are taken from the 1984/85 accounting statistics of the National Institute of Economics.

The *other members of the holder's family* and the *non-family labour regularly employed* (L/03 and L/04) are assumed to work full time.

2.5 1987 survey

2.5.1 Italy

The minimum marketed production qualifying a holding with less than 1 ha AAU for inclusion in the survey was increased from Lit 850 000 per farm year in 1985 to Lit 900 000.

2.5.2 Netherlands

The Netherlands were not able to provide the information on other gainful activities carried out by members of holder's family (spouse etc.). Eurostat estimated the figures on the basis on those supplied for the 1983 survey.

2.5.3 Denmark

There were 8 000 agricultural holdings of 0.5 to 5 ha UAA with under ECU 3 000 SGM.

Figures for work time of the farm labour force are based on a representative sample of approximately 2 300 holdings, and the Denmark was unable to supply a large number of data.

2.5.4 Greece

The data on type of tenure refer to the total area, and not the AAU.

2.5.5 Spain

Are included in this survey holdings with less than 1 ha AAU and:

- at least 0.2 ha area with horticulture or fruit under glass or in irrigated area;
- an SGM of at least 75 000 pesetas.

2.5.6 Portugal

In the case of combination of permanent crops and annual crops, the area in permanent crops is totally considered as principal and the annual crops is considered as successive secondary crop.

In the case of combinaison of annual crops and woodland, the area of annual crops is considered as principal.

2.6 1989-1990 survey

Switch from the FSSRS informatics system to the current Eurofarm system.

Managers were classified in the labour force category to which they belong: *holders* (L/01), *spouses* (L/02), *other members of the holder's family* (L/03) or *non-family labour* (L/04).

2.6.1 Denmark

There were 7 400 agricultural holdings of 0.5 to 5 ha UAA with under ECU 3 000 SGM.

Denmark submitted a sample of data taken from the full survey. For certain labour force characteristics, however, it prepared a second sample. When the tabular results were drawn up, it proved to be impossible to make a distinction between these two samples with the accuracy required to obtain more reliable results.

2.6.2 Germany

The full-scale survey included the *Länder* of Mecklenburg-Western Pomerania, Saxony-Anhalt, Saxony, Brandenburg, Thuringia and East Berlin as well as the old *Länder*.

It was not, however, possible to establish the typology of the agricultural holdings concerned. For this survey, therefore, there will be a distinction between:

- the non-typological data giving an overview of agriculture in Germany as a whole, and
- the typological data (with results per type of farming and SGM) representing agriculture in the 11 *Länder* which made up Germany before 3 October 1990.

In the tables, a double line separates the values for Germany before unification and after.

2.7 1993 survey

2.7.1 Germany

From 1993 onwards, holdings in the new *Länder* have been included in the classification.

2.8 1995 survey

2.8.1 List of characteristics

With the 1995 survey, there was a change in the breakdown of fallow land.

Up to the 1993 survey, *fallow land* was in every case included under D/21. *Fallow land subject to set-aside incentive schemes with the possibility of rotation* was detailed under I/06/a.

As from the 1995 survey, *fallow land subject to incentive schemes with no economic use* (D/22) is not included under D/21. Category D/22, included under I/08/a, thus corresponds to land left fallow under an incentive scheme.

2.8.2 Typology

As from 1995, *holdings specialising in field crops* (1) have been divided between:

- *holdings specialising in cereals and oilseeds* (13) and *general field cropping* (14),
- instead of *holdings specialising in cereals* (11) and *general field cropping* (12) as previously.

2.9 1997 survey

2.9.1 Sweden

The threshold for agricultural holdings was reduced to 2 ha of arable land.

3 COMMUNITY TYPOLOGY FOR AGRICULTURAL HOLDINGS

From the very first survey on the structure of agricultural holdings in 1966/67, it was clear that, in order to facilitate and broaden the interpretation of results, a classification system was needed to divide holdings into uniform groups as a function of their production structure. This classification also had to make it easier to compare the various Member States. Animal production has intensified in many different ways, either as regards livestock per forage area or, even more noticeably, with the increase in "indoor" livestock production, and this has rapidly made any classification linked solely to an area breakdown insufficient.

A typology became even more necessary with the development of the Common Agricultural Policy, which often requires information on specific groups of holdings as well as simulations which need uniform groups of agricultural holdings.

A Community typology was thus prepared, first of all on an experimental basis for the 1966/67 survey, and then on new bases as from the 1975 survey. A first holding classification system was established by Commission Decision (78/463/EEC) of 7 April 1978 and used to process the 1975, 1977, 1979/80 and 1983 surveys. This system was revised by Commission Decision (85/377/EEC) of 7 June 1985 and most recently amended by Decision (96/393/EC) of 13 June 1996.

3.1 The basis of the Community typology: Standard Gross Margins (SGM)

3.1.1 The construction of Standard Gross Margins

Most agricultural holding classification systems currently in force are based on two essential economic characteristics: type of farming and economic size of the holding. It is also generally accepted that the standard used to measure size should be the same as that used for classification purposes, although this is not compulsory. The Community typology respects both these principles, which are clearly set out in Article 1 of the relevant Commission decisions.

The choice of measuring unit is fairly free: some classifications are based on labour force requirements, some on output value and others on the concept of value added. The Community typology has opted for a concept close to the latter, that of Standard Gross Margin.

Gross margin means the gross margin on direct costs, i.e. the difference between the monetary value of agricultural production (gross production) and the specific costs which can be assigned to the output in question.

However, directly measuring the gross margins of each agricultural holding is a very complex operation and a very large volume of data has to be collected. It was therefore decided to measure the gross margin indirectly, using regional standard coefficients calculated by applying uniform definitions in each country. Standard Gross Margins (SGM) thus correspond to an average situation for a given region for each of the agricultural enterprises growing crops or rearing livestock.

SGMs are therefore different from (Figure 1):

- value added, which is non-specific, i.e. for which general operating costs are deducted;
- the gross margin on direct costs, for which the specific costs of labour, materials and buildings are deducted, and,
- of course, agricultural income, the share of the agricultural profit which is made available to the manager.

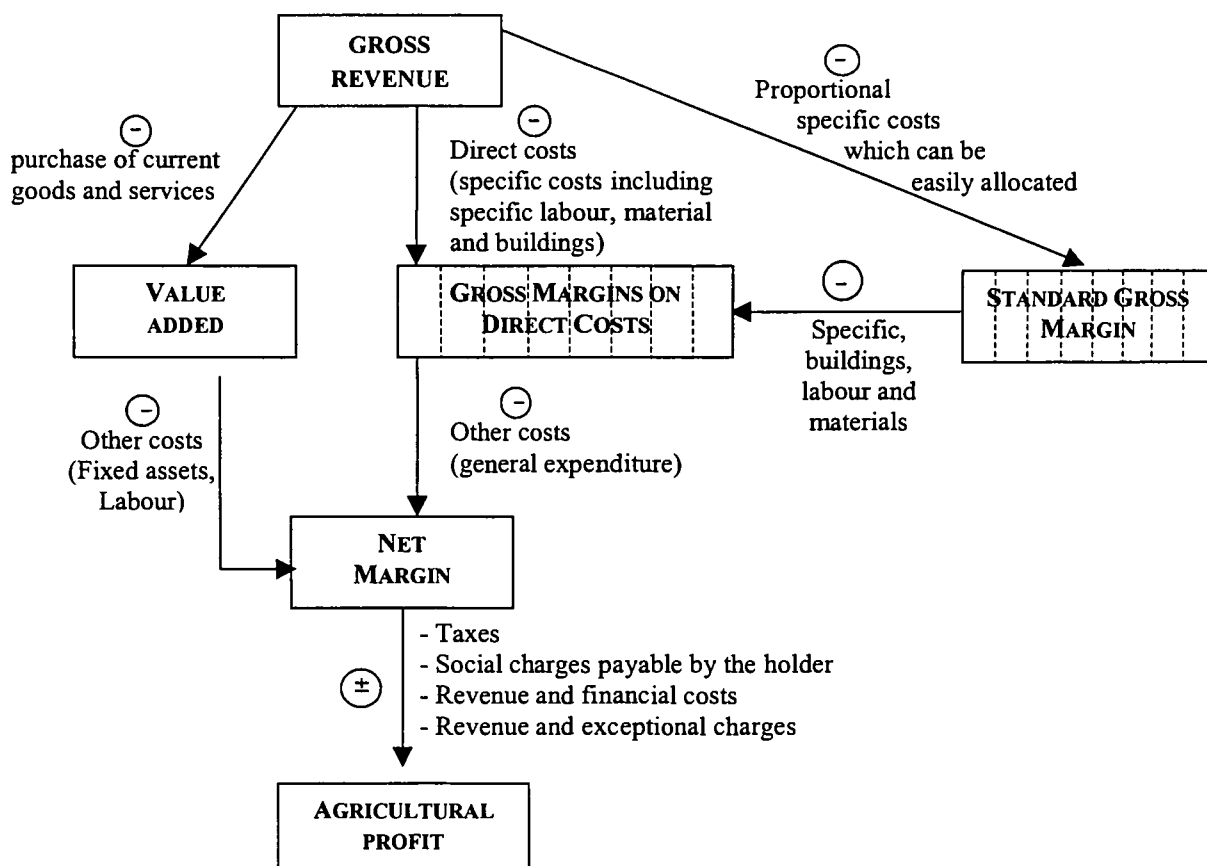

Figure 1: Formation of agricultural profit by cost

- *Gross production*

The basis for establishing SGMs is therefore the value of gross production. This comprises sales, payments in kind, increases in stocks and the inputs necessary for certain types of production within the holding (intra-branch consumption). It is generally based on ex-farm prices net of value added tax (VAT).

The products to be considered are not just agricultural products in the strictest sense; they also include packaged and processed products where packaging and processing generally take place on the farm in the region in question. The more advanced the packaging or processing stage of the products when they leave the holding, the higher are the ex-farm price and the costs to be deducted.

In addition to the value of the main products, gross production includes the value of any by-products and subsidies linked to products.

- *Specific costs*

Proportional specific costs are those which can be directly attached to a type of production (enterprise). They therefore exclude costs such as general operating costs, labour, machinery, buildings and most contract work (with a few exceptions).

In practice, the proportional specific costs to be deducted from gross production are as follows:

- crop production: seeds and seedlings, fertilisers purchased, crop protection products and various other specific costs (water for irrigation, heating, drying, marketing and insurance costs);
- livestock production: livestock replacement costs, animal feed and various specific costs (water, veterinary fees, milk testing and animal selection, heating, marketing and insurance);
- the SGMs of forage areas are included with those of the animal production which uses them.

The costs of means of production originating on the holding are valued on the basis of ex-farm production costs; for means of production purchased on the market, their purchase price is used. Calculations are net of VAT and any subsidies linked to products are deducted.

The production figure used to calculate SGMs covers a period of twelve consecutive months and the costs are those which relate to this production. However, SGMs are calculated from arithmetic averages for three calendar years or three consecutive agricultural marketing years. They are first calculated in national currency and then converted to ecus using the average exchange rates for the reference period.

3.1.2 Economic size of holdings

The SGM regional coefficient is thus defined per hectare of each type of crop production and per head of livestock (or 100 head of poultry). Each type of crop or animal production recorded on the holding is multiplied by the appropriate regional coefficient. The results obtained are aggregated for each type of production (enterprise) to determine the total Standard Gross Margin of the holding, which is also referred to as the "economic size of the holding".

This economic size is expressed in European Size Units (ESU). Until 1983, one ESU corresponded by definition to ECU 1 000 of Standard Gross Margin. Its value has been adjusted regularly to take account, in monetary terms, of overall agri-economic trends throughout the Community/European Union.

Survey	Reference period for SGM	1 ESU = ... ECU
1975	« 1973 »	1 000
1977	« 1973 »	1 000

1993	« 1990 »	1 200
1995	« 1992 »	1 200
1997	« 1994 »	1 200

3.1.3 Type of farming

The type of farming of a holding is determined by the composition of its total Standard Gross Margin and by the relative size of the predefined partial Standard Gross Margins. The Commission decisions define the type of farming in terms of the relative contribution of the various types of production to its total Standard Gross Margin.

In other words, for each holding the contribution of each type of animal or crop production to the total Standard Gross Margin has to be established. The provisions of the decision are then applied to the results to enable the holding to be classified under a particular type of farming. For example, if the gross margin which can be imputed to cereals accounts for more than two-thirds of the total gross margin, the holding will be classified under *specialist cereals, oilseeds and protein crops* (13).

The classification scheme used is a four-level tree structure:

- level one comprises eight general types of farming, i.e. four types of crop farming (field crops, horticulture, permanent crops and mixed cropping), three types of animal farming (grazing livestock, granivores and mixed livestock holdings) and one crop-livestock mix; the definition remains unchanged;
- level two comprises 17 principal types of farming, which are subdivisions of the general types. This is the level at which Community surveys on the structure of agricultural holdings are usually processed, but the change in typology in 1985 and again in 1995 has led to some modifications;

- level three comprises around 50 particular types of farming which are subdivisions of the principal types. Structure surveys provide only limited information at this level, which is already very specific: number of holdings, total gross margin and total area;
- the final level is used by only a few Member States to subdivide particular types of farming that are of importance to their agriculture.

N.B.: two particular cases:

- on holdings raising grazing livestock, the fodder crops used by the animals are normally counted as intermediate consumption. There are specific rules for dealing with cases of fodder imbalances (surpluses or deficits);
- for pig-rearing, a distinction is made between breeders and pigs used for breeding and fattening. Piglets are included in total SGM if - and only if - there are no breeding sows on the holding.

3.1.4 Outlook and limitations

The Standard Gross Margin may be used as an estimate of the POTENTIAL gross margin of holdings.

On the one hand, it varies with volumes of inputs and agricultural products. Seen in relation to the hectare or the individual animal, it is a reflection of how production has intensified. It also varies with the unit prices of inputs and agricultural products, and thus reflects the economic opportunity of production. Finally, when consolidated by holding it indicates the intensity of economic activity per unit of production and the economic opportunity of combinations of enterprise.

Various terms are used, depending on level and content:

Calculated over	Consolidated at the level of	
By type of production (enterprise)	Region	Standard coefficient
By type of production (enterprise)	Holding	Partial SGM
Combination of enterprises	Holding	Total SGM per holding
Holding	Group of holdings	Total SGM

The regional coefficients of the Standard Gross Margin are first calculated in national currencies and then converted to ecus.

The economic values used for the calculation of SGMs per enterprise are recorded over a period (three years) prior to the survey year. Where output fluctuates (the volume and price may vary considerably from one year to the next), there may therefore be a time-lag between the technical values (volumes) and economic values (prices).

Regular updating of the SGMs (every two years) raises the problem of the comparability over time of the results of different surveys on the structure of agricultural holdings, especially as regards the economic size of holdings.

SGMs have varied over time, following general agri-monetary trends. To try to remedy this, the value of the European Size Unit (ESU) is reviewed whenever SGMs are updated (i.e. every two or three years).

3.1.5 Influence on typology

Changes in SGMs also have an impact, to some extent, on the classification of holdings. The SGMs of enterprises do not all change at the same rate and those which increase most rapidly "attract" holdings towards their types of farming.

- *Treatment of forage areas*

For Ireland and the United Kingdom, the share of non-classified holdings was very much higher than in other Member States up to 1983, owing to the way forage areas were treated.

In these two countries, the lack of any market from which the price of green fodder could be determined generally makes it impossible to calculate these specific SGMs. Thus, until 1983, around 10% of the UK and Irish holdings were not classified in terms of the Community typology.

In order to solve this problem, it was decided, when the typology was revised, to allocate SGMs of a small amount (estimated as a lump sum) to permanent pasture and meadows not used by grazing livestock on the survey date.

This decision, which was first applied for the 1985 survey, influences the interpretation of the results, since virtually all holdings included in the typology on this basis are now classified under the type of farming referred to as *various grazing livestock - no dominant enterprise* (Code 444).

- *Treatment of land left fallow under an incentive scheme*

Subsidies have been associated with set-aside, for example. The classification of holdings has been affected by both the total SGM in the breakdown into economic size classes and the fall in the selling prices of crops which determine the specialisation of holdings.

The 1989/90 survey was not affected by these subsidies, or at least not significantly. The same cannot be said, however, of the 1993 survey, since subsidised fallow land was included in the calculation of the type of farming. For the 1995 and 1997 surveys, fallow land was subdivided into two categories, traditional agricultural fallow land (without any subsidies) and fallow land subject to set-aside incentive schemes, with no economic use (connected with the 1992 reform).

Until 1993, leaving land fallow was considered to be an agronomic practice and was relatively marginal in many countries.

The SGM coefficient attributed to fallow land was low but was not zero, in an attempt to make SGMs and UAAs consistent. By convention, fallow land was not taken into account when the type of farming was determined.

The 1992 CAP reform introduced an obligation to set land aside, and this made fallow land important in terms of crop rotation and receipts from holdings. Fallow land under a set-aside scheme was then counted as equivalent to land under crop and a partial SGM was allocated to it. Since then, it has been considered as a field crop for typology purposes.

Taking into account the set-aside scheme for arable land also led to the definition of a different type of farming, *specialist cereals, oilseeds and protein crops* (13) which was more consistent with these measures than *specialist cereals* (11). The definition of the type *specialist field crops* (1) was thus amended and the type *general field cropping* (12) became type 14.

3.2 Interpretation of the typology

The Community typology of agricultural holdings enables groups of holdings to be fairly uniform, since identical rules are applied in all Member States. However, a number of changes have to be pointed out, since they affect the results obtained.

3.2.1 Changes in the typology

Although the general principles governing the classification of holdings have not changed since the 1975 survey, the typology itself was amended for the 1985 and subsequent surveys, basically to bring it into line with the new-look European agriculture which emerged when three Mediterranean countries joined the Community.

Cf page 14, *Fallow land subject to set-aside incentive schemes*

3.2.2 Holdings not classified

Some holdings cannot be classified in terms of SGM, since they only have characteristics to which a nil SGM has been allocated. Their total Standard Gross Margin is therefore also nil.

In most countries, non-classification arises from the fact that, when a certain type of enterprise is considered to be non-existent in a given region, the SGM allocated is

zero. If it is found during the survey that this type does exist in the region, the classification will be distorted, whether or not the holding in question has a total SGM above zero.

4 UNITS OF MEASUREMENT

4.1 European Size Units (ESU)

Cf page 12.

4.2 Annual Work Units (AWU)

An annual work unit corresponds to the work performed by one person on an agricultural holding on a full-time basis during a full year.

"Full-time" is the minimum number of hours required by the national provisions governing contracts of employment. If such contracts do not indicate the number of hours, 1 800 hours a year (225 working days of eight hours each) is assumed.

A working day means the hours of work (a minimum of eight a day) carried out by the agricultural labour force working full time. Days of leave and sickness do not count as working days.

The information required for the Community list of characteristics covers the number of hours of work performed on the holding, expressed as a percentage of AWU, for the following five categories: the holder, the manager, the holder's spouse employed on the holding, other members of the holder's family and non-family labour regularly employed. In the case of workers not regularly employed, the number of working days is recorded.

Persons working a minimum of 1 800 hours a year are considered to be full-time workers and count as one annual work unit (AWU). The performance of part-time workers is converted into AWU pro rata.

4.3 Livestock Units (LSU)

A Livestock Unit represents the quantity of feed energy needed by a reference animal (by convention, since 1977 a dairy cow with an annual milk yield of 3 000 kg) to cover its maintenance and production requirements.

The LSU is thus a reference unit common to the various categories of animal and relates to their feed requirements.

The closer the feeding method of an animal is to that of the reference animal (ruminant in low-intensity production), the more pertinent the LSU. However, for want of any other common unit, the LSU can be used to consolidate statistics on animals of the same species but of different ages, and can also be used as a common unit for measuring livestock numbers, as long as the limits of this theoretical unit are taken into account when the data are interpreted.

**COEFFICIENTS OF EQUIVALENCE of the categories of animal
listed in the Farm Structure Survey**

Equidae (J/01)	0.8	LSU per head
Bovine animals:		
Under one year old (J/02)	0.4	LSU per head
One but less than two years:		
Male (J/03) and Female animals (J/04)	0.7	LSU per head
Two years old and over:		
Male animals (J/05)	1.0	LSU per head
Heifers (J/06)	0.8	LSU per head
Dairy cows (J/07)	1.0	LSU per head
Other cows (J/08)	0.8	LSU per head
Sheep (all ages) (J/09)	0.1	LSU per head
Goats (all ages) (J/10)	0.1	LSU per head
Pigs:		
Piglets having a live weight of under 20 kg (J/11)	2.7	LSU per 100 head
Breeding sows weighing 50 kg and over (J/12)	0.5	LSU per 100 head
Other pigs (J/13)	0.3	LSU per 100 head
Broilers (J/14)	0.7	LSU per 100 head
Laying hens (J/15)	1.4	LSU per 100 head
Other poultry (ducks, turkeys, geese and guinea fowl) (J/16)	3.0	LSU per 100 head
Rabbits, breeding females (J/17)	2.0	LSU per 100 head

5 LIST OF CHARACTERISTICS (1997)

A: GEOGRAPHICAL SITUATION OF THE HOLDING

B: LEGAL PERSONALITY AND MANAGEMENT OF THE HOLDING

C: TYPE OF TENURE AND FRAGMENTATION OF THE HOLDING

C/01: Owner-farmed agricultural area

C/02: Tenant-farmed agricultural area

C/03: Agricultural area share-farmed or farmed under other modes

D: ARABLE LAND

D/01: Common wheat and spelt

D/02: Durum wheat

D/03: Rye (Including meslin)

D/04: Barley

D/05: Oats (Including summer meslin)

D/06: Grain maize

D/07: Rice

D/08: Other cereals

D/09: Pulses for harvest as grain (including seed and mixtures of pulses and cereals)

D/10: Potatoes (including early potatoes and seed potatoes)

D/11: Sugar beet (excluding seeds)

D/12: Forage roots and tubers (excluding seeds)

D/13: Industrial crops (including seeds for herbaceous oil seed plants, excluding seeds for fibre plants, hops, tobacco and other industrial crops) of which:

D/14: Fresh vegetables, melons, strawberries: outdoor or under low (non-accessible) cover

D/15: Fresh vegetables, melons, strawberries: under glass or high (accessible) protective cover

D/16: Flowers and ornamental plants (excluding nurseries): outdoor or under low (non-accessible) cover

D/17: Flowers and ornamental plants (excluding nurseries) under glass or (accessible) protective cover

D/18: Forage plants

D/18a: Temporary grass

D/18b: other

D/19: Arable land seeds and seedlings (excluding cereals, pulses, potatoes and oil seed plants)

D/20: Other arable crops

D/21: Fallow land

D/22: Fallow land subject to set-aside incentive schemes with no economic use

E: KITCHEN GARDENS

F: PERMANENT PASTURE AND MEADOW

F/01: Pasture and meadow, excluding rough grazing

F/02: Rough grazing

G: PERMANENT CROPS

G/01: Fruit and berry plantations

G/02: Citrus plantations

G/03: Olive plantations

G/04: Vineyards

G/04a: Vineyards, of which normally producing: quality wine

G/04b: Vineyards, of which normally producing: other wines

G/04c: Vineyards, of which normally producing: table grapes

G/04d: Vineyards, of which normally producing: raisins

G/05: Nurseries

- G/06: Other permanent crops
- G/07: Permanent crops under glass
- H: OTHER LAND**
 - H/01: Unutilized agricultural land (agricultural land which is no longer farmed, for economic, social or other reasons, and which is not used in the crop)
 - H/02: Woodland
 - H/03: Other land (land occupied by buildings, pleasure gardens, farmyards, tracks, ponds, quarries, infertile land, rock, etc.).
- I: COMBINED AND SUCCESSIVE SECONDARY CROPPING, MUSHROOMS, IRRIGATION, GREENHOUSES, SET-ASIDE OF ARABLE LAND**
 - I/01: Successive secondary crops (excluding market-garden crops and crops under glass)
 - I/02: Mushrooms
 - I/03: Irrigated area
 - I/04: Ground area covered by greenhouses in use
 - I/05: Combined crops
 - I/06: Land subject to the set-aside incentive scheme for arable land and recorded under
 - I/08: Area subject to set-aside incentive schemes
- J: LIVESTOCK (on the day of the survey)**
 - J/01: Equidae (Riding and racehorses are included)
 - J/02: Bovine animals under one year old
 - J/03: Male bovine animals one but less than two years old
 - J/04: Female bovine animals one but less than two years old
 - J/05: Bovine animals two years old and over, male
 - J/06: Heifers
 - J/07: Dairy cows
 - J/08: Other cows
 - J/09: Sheep (all ages)
 - J/10: Goats (all ages)
 - J/11: Piglets having a live weight of under 20 kilograms
 - J/12: Breeding sows weighing 50 kilograms and over (Cull sows are excluded).
 - J/13: Other pigs
 - J/14: Broilers
 - J/15: Laying hens
 - J/16: Other poultry (ducks, turkeys, geese, guinea-fowl)
 - J/17: Rabbits: breeding females (Female rabbits which have littered).
 - J/18: Bees
 - J/19: Other livestock
- K: TRACTORS, CULTIVATORS, MACHINERY AND EQUIPMENT**
- L: FARM LABOUR FORCE**
 - L/01 and L/01a: Holder and holding manager (These are defined under B/01 and B/02)
 - L/02: Holder's spouse
 - L/03: Other members of the holder's family
 - L/04: Non-family labour regularly employed
 - L/05 and L/06: Non-family labour not regularly employed
 - L/07 to L/09: Other gainful activity
 - L/10: Total number of working days of agricultural work, not included under L/01 to L/06, undertaken on the holding by persons not employed directly by the holding (e.g. contractors' employees)

General characteristics of the structure of agricultural holdings

The physical size of agricultural holdings

Trends 75-97 (EU-9)

Number of holdings : -28.8 %
AA : +0.6 %

Trends 87-97 (EU-12)

Number of holdings : -23.7 %
AA : +4.0 %

Smallest holdings rapidly disappearing

Between 1967 and 1997, the agricultural sector in EU-6 lost almost 2.6 million farms of which almost half were under 5 ha. The countries which experienced the greatest losses were Italy, Germany and France which lost 430,000, 360,000 and 325,000 farms respectively.

UAA \ period	Change	Average annual variations			
	1967 - 1997	1967 - 1997	1967 - 1975	1975-1987	1987 - 1997
Less than 5 ha	-37%	-1.5%	-2.6%	-0.3%	-2.2%
5-20 ha	-63%	-3.3%	-4.2%	-2.4%	-3.6%
20 and more	-6%	-0.2%	+1.1%	-0.2%	-1.3%
Total	-42%	-1.8%	-2.6%	-0.8%	-2.3%

Table 1: Changes in the number of holdings by size of UAA in EU-6

From 1975 to 1997, the reduction in the number of holdings of less than 5 ha was more marked in Ireland and Denmark (cf. change in survey threshold) than in the founding countries (a reduction of 68% and 87% respectively as against 23% in EU-6).

For the 1987-1997 period, the number of holdings under 5 ha fell by a quarter in the 12 EU Member States. This reduction was most apparent in Spain and Portugal which lost 40% of their farms in this category.

Finally, between 1995 and 1997 the decrease in the number of holdings under 5 ha remained steady in EU-15 (7%). Ireland and Finland lost a quarter of their farms under 5 ha whereas in Sweden (with a change in survey threshold) the number of such farms increased by one in six.

Large farms on the rise

While there was a significant fall in the number of small holdings across Europe, the number of farms of 50 ha and more increased steadily.

In Germany, the number of large farms in this category increased by a factor of 4.4 between 1967 and 1997. In the old *Länder*, this figure rose by a factor of 3.8. German reunification was one reason for this increase (14% of German agricultural holdings of 50 ha and more were located in the new *Länder* in 1997).

The number of holdings of at least 50 ha doubled between 1967 and 1997 in the six EU founding members. The number of such farms rose by only 17% in Italy, but more than tripled in the Benelux states.

Between 1975 and 1997, there was an increase of 74% in the number of large holdings in Denmark where the agricultural sector underwent radical restructuring. The United Kingdom, where the holdings were already very large and concentrated, their number fell.

From 1995 to 1997, the general trend towards a greater number of farms of 50 ha or more continued in most of the EU Member States. In Greece the number of such farms continued to fall. In the United Kingdom, concentration among such farms has also led to a reduction in number. In Portugal there appears to have been a reversal of the trend to increasing number of large holdings. In Finland, their number increased by 17% in two years however.

Type of tenure

Owner-occupied farms still the most common type of agricultural holding

In EU-15, owner-occupied and tenant farms accounted for 98% of the types of agricultural holding in the UAA in 1997.

In 1970, in EU-6, broadly two thirds of the UAA was given over to owner-occupied farms and one third to tenant farms. Between 1970 and 1997, there was a steady increase in tenant farming at the expense of owner-occupied farming. In 1997, the proportion of the UAA farmed by owner-occupied holdings fell to almost 47% in EU-6 and tenant farms became the most common type of agricultural holding.

These trends are discernible in EU-12 and EU-15 over shorter periods and are thus less pronounced. Thus between 1987 and 1997, the proportion of the UAA managed by owner-occupied farms in EU-12 fell from 68% to 58%. In EU-12 as in EU-15, the majority of farms have been owner-occupied. In 1997, 59% of the UAA in EU-15 was still farmed by owner-occupied holdings.

The situation is nevertheless different, opposing a Europe of family owners, marked by the owner farmed holdings (Italy, Greece, Spain, Portugal, and also Ireland and Denmark) to a Europe where the rent is most pronounced.

This phenomenon is due, on the one hand, to the sharp decline in the number of small farms which are usually owner-occupied. On the other, the need for large amounts of capital to purchase farms of ever increasing size often leads to tenant farming.

Land use

Utilised agricultural area (UAA)

Arable land (D), *kitchen gardens* (E), *permanent pasture and meadow* (F), and *permanent crops* (G) make up the utilised agricultural area (UAA) of a holding. While surveys on the structure of agricultural holdings provide accurate information about *permanent crops* and *arable land*, there is no overall figure for *permanent pasture and meadow* on agricultural holdings covered by the surveys. Common and rough grazing and rented grassland often belong to local authorities or non-farming owners. They are therefore missed in surveys on the structure of agricultural holdings, which are defined by each Member State above a certain size.

Steady decline in permanent meadow and pasture

In spite of the various enlargements that have occurred, the breakdown of utilised agricultural area in EU-15 in 1997 was similar that of EU-6 in 1967.

In 1967 the figures in EU-6 were 56% for *arable land*, 38% for *permanent pasture and meadow* and 9% for *permanent crops*; the corresponding figures in EU-15 in 1997 were 57%, 35% and 8%.

Between 1967 and 1987 total UAA fell by 5.4 million hectares (-9%) in EU-6, declining from 64.4 to 59.0 million hectares. Between 1987 and 1997 it apparently increased by 4.9 million hectares. The fact is that the five new German *Länder* accounted for about 5.6 million hectares of UAA in 1997 (80% *arable land* and 20% *permanent pasture and meadow*). UAA in EU-6, excluding the former East Germany, thus declined by -9%. In the six other EU-12 countries, again between 1987 and 1997, the figure remained more or less unchanged (-0.6%).

The reduction in UAA in EU-6 (disregarding German unification) was accompanied between 1967 and 1997 by a decrease in *permanent pasture and meadow* (-27 %) and *permanent crops* (-17 %), whereas *arable land* increased (+4.%). This rise in the area of *arable land* in EU-6 was particularly marked between 1987 and 1997.

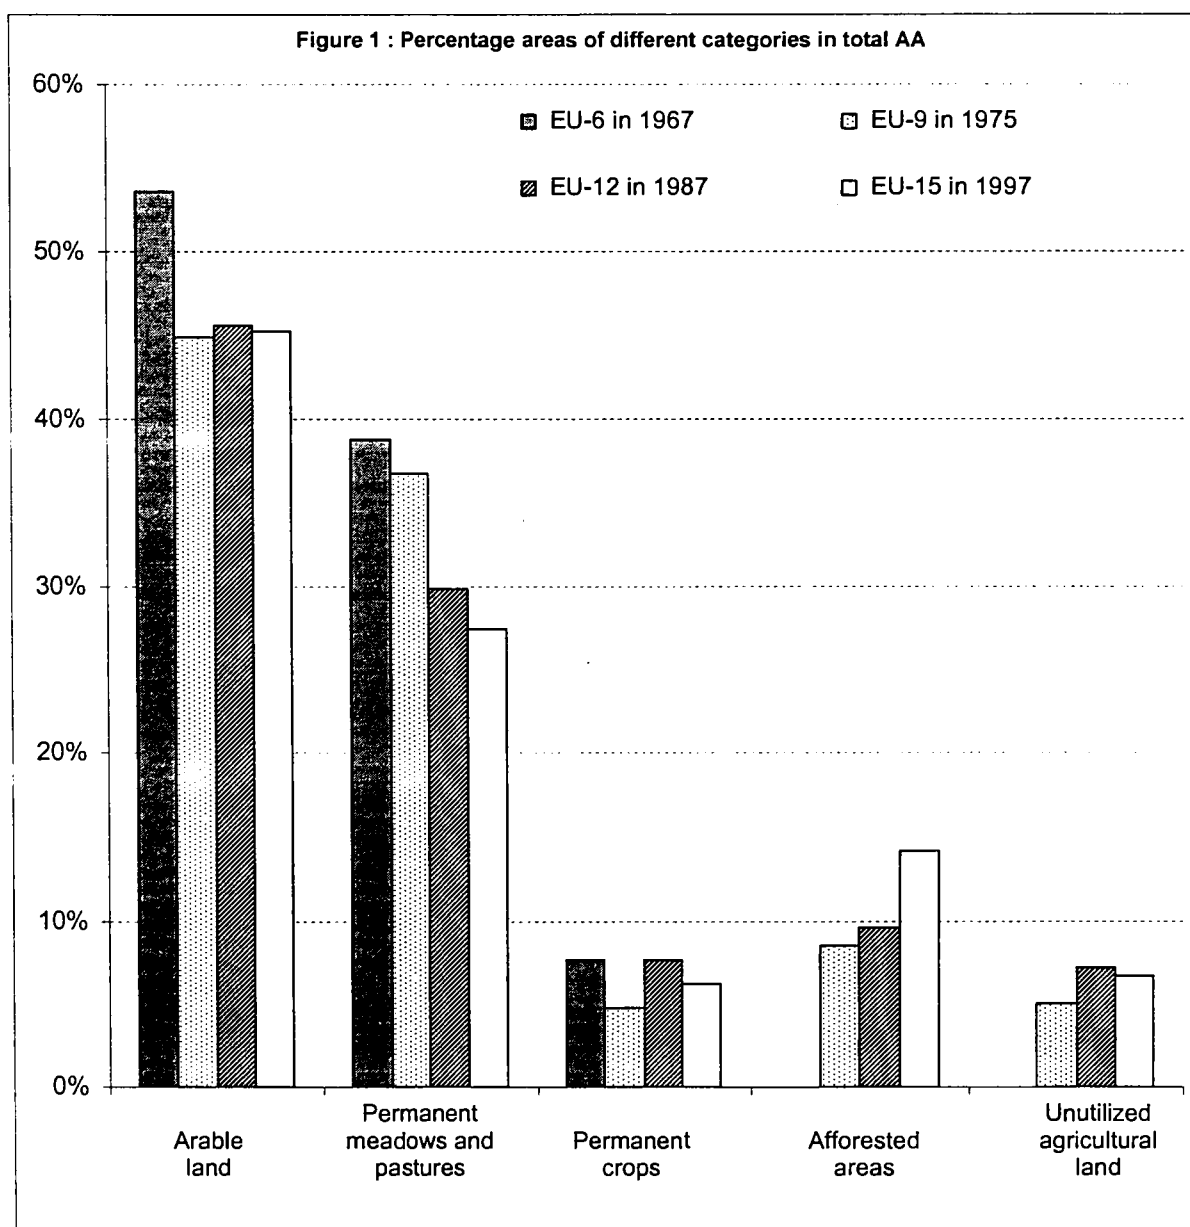

In the other EU-12 countries the area of *arable land* went down by 1.9 million hectares, while *permanent pasture and meadow* increased by the same amount. Both groups comprising EU-12 recorded a drop of 5% in *permanent crops*.

Features of these matching patterns between 1987 and 1997 include:

- Germany (excluding the new *Länder*), France, Benelux and to a lesser extent Ireland, recorded an increase in *arable land* (+7 %), while there was a shrinkage of *permanent pasture and meadow* (-12 %);
- Spain, Portugal and Denmark recorded the opposite effect: -8% for *arable land* and +44% for *permanent pasture and meadow*;
- Greece, Italy and the United Kingdom recorded declining figures for each component of UAA: -4% for *arable land*, -5% for *permanent pasture and meadow* and -6% for *permanent crops*.

Table 1 : Changes in surface composition

Arable land (D)

Trends 75-97 (EU-9)

Number of holdings : -42.1 %
Area with arable land : +12.3 %

Trends 87-97 (EU-12)

Number of holdings : -31.2 %
Area with arable land : +6.8 %

Fewer holdings having arable land

Between 1967 and 1997, the number of holdings with arable land fell by more than a half in the 6 founder countries : 2.8 million holdings disappeared or abandoned arable land crops during this period. France, Italy and Germany « lost » respectively 935,000, 920,000 and 752,000 holdings having arable land.

In the other countries of EU-6, the number of holdings having arable land has fallen by more than half. This reduction varies from - 56% in the Netherlands to - 68% in Belgium.

Over the period 1975-1997, the number of these holdings also decreased, but the trends are more contrasted between the various Member States. This figure is relatively low in Italy, in the Netherlands and in the United Kingdom (respectively -32%, -26%, -35%) for an average in EU-9 of -42%. On the other hand, it exceeds -50% for the other countries, including the new adherent countries. Denmark and Ireland restructured their agriculture following their entry to the EU.

In the decade 1987-1997, the number of holdings having arable land declined more strongly than for the total of all the European agricultural holdings. For EU-12, this change reached -31 %, against -24 % for all the holdings between 1987 and 1997. In the last 10 years, a third of holdings either no longer have arable land or have disappeared. The tendency is even more pronounced for the holdings having cereals (-37 %).

As much arable land in much fewer holdings

In 1997, more than half of the UAA of the European Union was occupied by arable land (67.4 million hectares of the 128.5 million hectares of UAA of EU-15, i.e. 52.5%).

Although the number of holdings having arable land has strongly declined for 30 years, the area of arable land was maintained on the whole and even slightly increased in certain countries.

Between 1967 and 1997, in EU-6, the area of arable land increased by 17% (rising from 34.5 to 40.3 million hectares). During these 30 years the area of arable land per holding did not cease to increase. It more than doubled in EU-6 rising from 6.7 ha in 1967 to 17.0 ha in 1997. The increase is however different amongst the countries (figure 2).

Between 1975 and 1997, the average area out of arable land almost doubled in EU-9. It rose from 9.8 to 19.1 ha per holding but this progression hides large disparities.

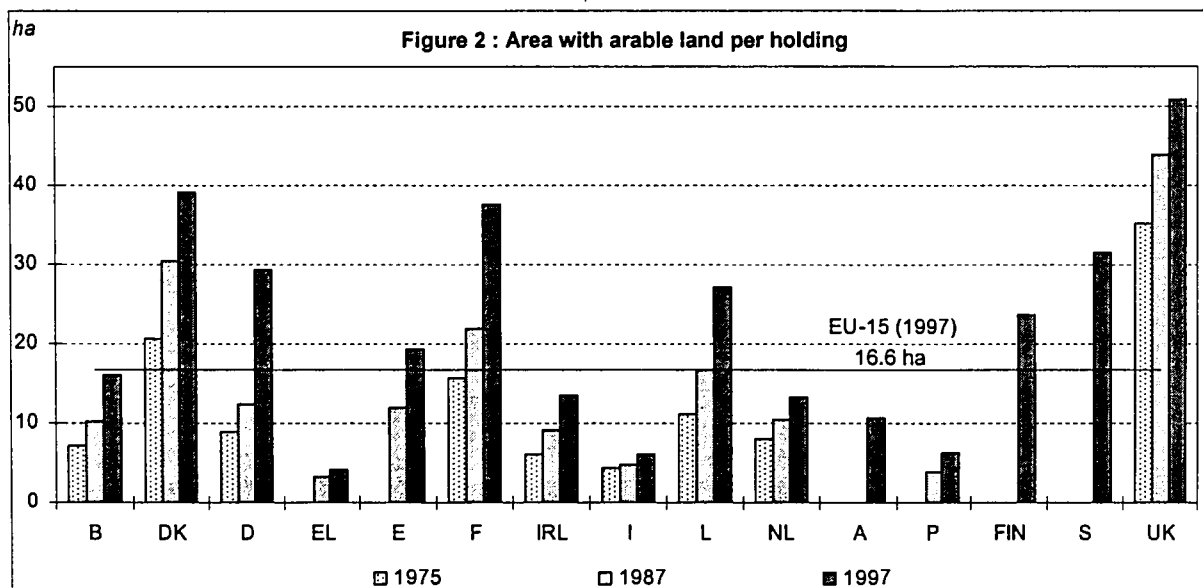

In Italy and in the United Kingdom, the increase in the average area of arable land is more moderate in relation to the other Member States. Italy saw its average area of arable land increase from 4.4 ha to 6.1 ha per holding. This average area is by far the smallest in EU-9. In the **United Kingdom**, the situation is opposite. The increase is weak because holdings were already large in 1975. The average area of the arable land by holding had already exceeded 35 ha in the United Kingdom in 1975. (Figure 2)

Between 1987 and 1997, the consolidation of holdings having arable land is also marked. It is particularly strong for the Member States of Central Europe (France, Germany, and Luxembourg, Belgium). In France, for example, the average area of arable land increased by 71% in 10 years (i.e. more than 6 ha extra per holding). The increase is also appreciable in the new Member States (Spain, Portugal) with the disappearance of numerous small holdings

Cereals (D/01 to D/08)

Trends 75-97 (EU-9)	Number of holdings : -49.3 %	Trends 87-97 (EU-12)	Number of holdings : -36.3 %
	Area under cereals : +2.9 %		Area under cereals : +0.8 %

While the number of holdings with cereals has been falling in Europe, the area under cereals has remained relatively stable. It increased in EU-6 by 7 % between 1967 and 1997, and by 1 % only in EU-12 between 1987 and 1997. German reunification masks falls in area of cereals of 6 % in EU-6 and in EU-12 over the reference periods if one excludes the ex GDR.

With 17.4 million hectares in 1997, wheat is the clearly dominant crop. It represents more than one quarter of the arable area in EU-15 and 45 % of the cereal area. Between 1967 and 1975 wheat area decreased in EU-6, but increased between 1975 to 1997.

The area under coarse grains is declining in the centre and the south of Europe. The possibility of substitution by more profitable crops, and the modification of cultivation methods, which made it possible to get more out of a land with low agriculture value, explain this phenomenon. Moreover, oats and rye, previously needed for own consumption, no longer fit farmers' economic approaches. However, coarse grains remain essential in the Scandinavian countries to which they are well adapted, with attractive yields, and where no other cropping possibility is available to farmers.

From 1975 to 1993 the area under oats decreased by half in EU-9. Since 1993 it has again been increasing. Between 1995 and 1997 it rose by 8% in EU-15.

Between 1975 and 1997 rye growing was important in the new German Länder and, in EU-9 the rye area rose by 20 % (-33% without former East Germany). It decreased by 6 % between 1995 and 1997 in EU-15.

Despite some variability, grain maize cultivation progressed overall, in particular for animal feed. Its area increased by 45 % between 1970 and 1997 in EU-9. Between 1987 and 1997 it fluctuated depending on the economic situation and the weather. Between 1995 and 1997 it rose by 17 % in EU-15. Maize is a key crop in numerous southern regions of Europe where it puts irrigation facilities to good use and benefits from the high temperatures. It has also expanded in cattle-rearing areas providing near at home supplies.

Fallow land (D/21)

(definition page 61)

Fallow land is an integral part of several European farming systems. In 1987, when no set-aside arrangements had yet been put in place, the area of fallow land was 4.1 million ha.

Between 1987 and 1993 in EU-12* (without the five new German *Länder*), the area of fallow land doubled to 8.2 million ha. This increase was in large part due to fallow land subject to set-aside incentive schemes. Between 1987 and 1997, the area of agricultural fallow land declined from 4.1 million ha to 3 million ha, whilst fallow land subject to set-aside incentive schemes increased from zero ha to 2.5 million ha over the same period. In 1995, 4.5 million ha of fallow land was subject to set-aside incentive schemes with a compulsory set-aside rate of 10%. In 1997, only 2.5 million ha remained, with a compulsory set-aside rate of 5%.

In 1988, voluntary set-aside was proposed in order to reduce cereal production. Following the 1992 CAP reform, set-aside became compulsory for farmers producing more than 92 tonnes of cereals.

Since 1993, the trend for set-aside area has been closely linked to the set-aside rate applied.

In EU-15 in 1997, only one in five holdings producing cereals (600 000 holdings) had fallow land under incentive schemes. There was therefore a large number of small producers not subject to the CAP restrictions (over 2 million farmers), particularly in the countries of southern Europe.

The set-aside rate declined from 10% in 1995 to 5% in 1997. In EU-15, the total area of fallow land thus declined by 3,6 million ha (from 9 million ha to 5.5 million ha) and fallow land subject to set-aside incentive schemes declined by 2.4 million ha (from 5.7 million ha to 3.3 million ha).

In EU-15, the way in which farmers applied set-aside or reconverted land is documented in the survey on the structure of agricultural holdings (Table 4). Of the 4.2 million hectares receiving financial aid in 1997, more than three quarters were subject to set-aside incentive schemes and had no economic use. There was a comparable proportion in 1995 for the 7.5 million hectares set aside. Industrial crops for non-food production (rape, beet etc.) were grown on 14% of the total area receiving financial aid in 1995 and on 12% of this area in 1997. Both cases involved temporary withdrawal measures.

	1995		1997	
	1000 ha	%	1000 ha	%
"Agricultural" fallow land (D/21)	3385	-	2204	-
Fallow land subject to set-aside incentive schemes	7483	100.0% ¹	4306	100.0%
of which, - fallow land (D/22)	5658	75.6%	3291	76.4%
- industrial crops	1015	13.6%	499	11.6%
- conversion to grassland	699	9.3%	367	8.5%
- conversion to wooded area	54	0.7%	129	3.0%
- other	19	0.2%	20	0.5%

¹ Grassland, wooded area and other land are not broken down for Germany in 1995 (38,000 ha), hence the total of less than 100% for the sum of the sub-categories of areas subject to incentive schemes.

Definition

According to Official Journals No° L 251 of 12/09/1983: 0100-0136 ; L 391 of 30/12/1989: 0001-0041 ; n° L 149 of 06/06/1997

Fallow land is arable land which is left to recover, normally for the whole of the crop year. It should not be confused with catch crops, which are grown during the crop year without producing a harvest. It is part of crop rotation, unlike unutilised agricultural area, which remains uncultivated for at least five consecutive years. Fallow land may be:

1. bare land bearing no crops at all;
2. land with spontaneous natural growth, which may be used as feed or ploughed in;
3. land sown exclusively for the production of green manure (green fallow).

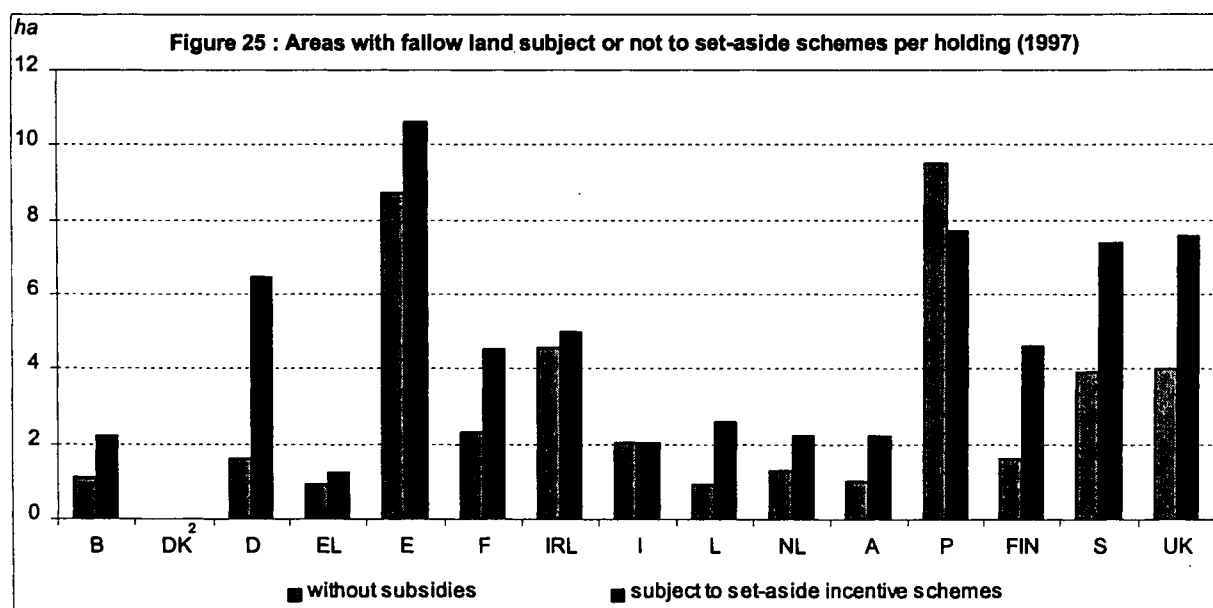

Fallow land without any subsidies:

All land included in the crop rotation system, whether worked or not, but not producing a harvest for the duration of a crop year, for which no financial aid or subsidy is paid for the reference year.

Fallow land subject to set-aside incentive schemes with no economic use:

Areas for which the holding is entitled to financial aid in order to encourage the set-aside of arable land according to Council Regulation (EEC) No. 797/85, last amended by Council Regulation (EEC) No. 1137/88, and according to Commission Regulations (EEC) No. 1272/88 and No. 1273/88 and, where applicable, the most recent legislation (for 1989/90 and 1993).

Areas for which the holding is entitled to financial aid in order to encourage the set-aside of arable land according to Council Regulation (EEC) No. 2328/91, as well as according to Council Regulation (EEC) No. 1765/92 and Commission Regulation (EEC) No. 334/93 or, where applicable, the most recent legislation (for 1995 and 1997).

² Denmark opted for other forms of resting or withdrawing land (pasture).

Fresh vegetables, melons, strawberries

In 1997, 765 000 holdings were producing *fresh vegetables, melons and strawberries* in EU-15 on an area of 1.3 million ha, 5% of which (67 000 ha) was under glass. Italy, France and Spain accounted for more than 60% of the total field-cropping area. Almost half of the areas under glass were in Spain, and almost a quarter in Italy. Production under glass accounted for 5.2% of *fresh vegetables, melons and strawberries* in EU-15, with 13% in Spain, 6% in Italy and 6% in the Netherlands. In the other Member States the figures were lower than the European average. *Fresh vegetables, melons and strawberries* accounted for 70% are areas under glass.

The areas of *fresh vegetables, melons and strawberries* grown under glass increased by 60% in EU-12 between 1987 and 1997. In Spain, they more than doubled, but fell in Greece, the Netherlands and the United Kingdom. The European average for field-cropping areas fell by 4%, although such production increased in Germany (+53% in the old *Länder*), the Netherlands (+12%) and Belgium (+11%), partly replacing root-crops.

The average outdoor area under *fresh vegetables, melons and strawberries* per holding having such areas rose from 1 ha to 2.3 ha between 1975 and 1997 in EU-9, and from de 1.1 ha to 1.7 ha between 1987 and 1997 in EU-12. In the case of crops grown under glass, the increase was due largely to expansion in Spain and concentration in the Netherlands.

Fresh vegetables, melons, strawberries (D/14 – D/15)

Flowers and ornamental plants

In 1997, 76 000 holdings in EU-15 grew *flowers and ornamental plants*. The average area under *flowers and ornamental plants* per holding having such areas was small (1.07 ha). A large proportion of these products was grown under glass (29%). Nevertheless, *flowers and ornamental plants* accounted for only one quarter of the total areas under glass. Italy and the Netherlands together had more than half of the area under glass in Europe and almost 60% of the outdoor areas.

Between 1987 and 1997, the areas under *flowers and ornamental plants* increased by one quarter in EU-12. They doubled in Spain and increased by 80% in Portugal. They increased by a factor of 2.8 in Greece, 2.5 in Portugal and 2.1 in Spain, compared with the EU-12 average of 1.3. The number of holdings with *flowers and ornamental plants* under glass increased by a factor of 2.1 in Greece, 1.8 in Portugal and 1.7 in Spain, but fell by 2% in EU-12. In 1997, these three countries accounted for 17% of the total area of *flowers and ornamental plants* under glass in EU-12, compared with 10% in 1987.

Permanent pastures and meadows (F)

A third of farmland in Europe...

In 1999 there were seven million agricultural holdings in the European Union (EU-15) covering a utilised agricultural area (UAA) of 128.7 million hectares.

Permanent pasture and meadow accounted for more than a third of this total area. The United Kingdom (9.5 million hectares), France (8.7 million) and Spain (8.6 million) are the main grassland countries, together totalling about 60% of all permanent meadow and pasture in the EU.

Rough grazing accounts for 36% of permanent pasture and meadow in the Union. The figure varies widely from country to country, reaching 46% in the United Kingdom and as much as 76% in Spain. In Italy, there is no breakdown of grassland use.

... involving one holding in three

There is no uniform distribution of permanent pasture and meadow, and only 37% of all holdings are involved. For holdings with grassland, the average area amounted to 17.2 hectares in 1997 (i.e. 35% of UAA).

- In terms of area, permanent pasture and meadow accounted for only 1% of UAA in Finland, less than 12% in Sweden and Denmark, and only slightly more in Greece. Grassland was the biggest component of land use in the United Kingdom, Austria and Luxembourg, and in Ireland accounted for as much as three quarters of UAA.

- Barely 10% of holdings in Greece and Finland have permanent meadows. In Italy and in the Iberian peninsula, the figure is only one holding in four. They feature much more prominently in other countries, involving more than two in every three holdings in Belgium, Denmark, France and the Netherlands and three out of four in Austria, Germany, Ireland, Luxembourg and the United Kingdom.

Grassland areas by holding up by 38% in ten years

In 1987 the average area of permanent pasture and meadow among holdings with grassland was under 13 hectares. The increase in the average area of grassland (+38%) between 1987 and 1997 in EU-12 matches the general increase in the size of holdings in the same period (+36%).

Permanent crops (G)

Trends 75-97 (EU-9) Number of holdings : -26.7 %
 Area with permanent crops : -13.6 %

Trends 87-97 (EU-12) Number of holdings : -20.1 %
 Area with permanent crops : -5.0 %

Permanent crops account for 7.9% of the UAA of EU-15 in 1997. This share fell from 7.6% to 6.5% in EU-6 between 1967 and 1997 and from 9.2% to 8.4% in EU-12 between 1987 and 1997. Together, the vine and the olive-tree occupy nearly 3/4 of the surface area in permanent crops. This explains the concentration of permanent crops in Mediterranean Europe.

Thus in 1997, Spain and Italy account for more than two thirds of the surface area in permanent crops of EU-15. Adding France, Greece and Portugal these total 96% of the total surface area including 95% of the vineyard, and the totality of the citrus and olive groves (Figure 1).

In EU-9 between 1975 and 1997 more than one holding out of four having permanent crops disappeared (-680,000 holdings) and nearly one in two of the vineyards (-840,000 holdings).

The decrease in the number of holdings having permanent crops was less than that of all the holdings.

The fall in area of permanent crops is more limited than the fall of the number of holdings with permanent crops, resulting in an increase in the average surface area of the holdings with permanent crops. The average surface area rose from 1.9 ha to 2.2 ha (+18%) in EU-9, between 1975 and 1997.

In EU-12, between 1987 and 1997, the number of holdings having permanent crops fell by 20%, mainly due to the effect of the restructuring of the Spanish and Portuguese agricultures and the disappearance of a large number of smallholdings.

The reduction in the surface area of holdings with permanent crops (Table 1) is primarily due to the decline of the vineyard, the share of which fell from 52% to 44% of permanent crops in EU-9 between 1975 and 1997, and from 36% to 31% in EU-12 between 1987 and 1997. The surface area in olive-trees, for their part, rose from 23% to 27% of the surface area of EU-9 in permanent crops between 1975 and 1997, and from 38% to 42% of that of EU-12 between 1987 and 1997.

In EU-6, with the exception of Italy, the number of holdings specialising towards permanent crops (FT 3) declined between 1975 and 1997. In Italy it rose by 28% partly due to the stronger persistence of permanent crops than to that of other uses and partly due to the strength of this specialisation (by number of holdings) in agriculture.

The development of the olive groves is linked with the increased importance of this crop in Europe, after the Mediterranean enlargement in 1981 and 1986. The incentive measures to the replanting of certain varieties and the COM olives contributed to the modernisation of the olive groves. The restructuring of the channels made it possible to once again give olive oil an image of quality, and to recover market share. The dietetic qualities of this product also helped in recovering market share. Moreover, the olive-tree resists difficult agronomic conditions and technical progress allowed for the shortening on the return on investment and an increase in output.

The number of holdings having olive groves remained stable in EU-9 (Italy and France) between 1975 and 1997 (+1%) and decreased only by 5% in EU-12 between 1987 and 1997. The surface area for its part increased by 13% in EU-9 between 1975 and 1997, and by 5% in EU-12 between 1987 and 1997.

The strength of wine-growing

The fall of the surface area intended for *other wine* production

The vineyard in 1997 represented 2.4% of the UAA of EU-15. In EU-9, between 1975 and 1997, its surface area decreased by more than one quarter, i.e. 0.7 million hectares. A more detailed analysis of the various vineyards makes it possible to explain this phenomenon (Figure 6).

The development reflects restructuring of the vineyard, reducing the surface area of wine-production of lower quality. Thus in EU-12, between 1987 and 1997, the share of the vineyards producing quality wines rose from 39% to 50% of the surface area, and that producing other wines declined from 55 to 44%.

Between 1980 and 1997, in EU-9, surface area in vineyards producing quality wines increased by 35% while they decreased by 40% for the other wines. Over this same period, still in EU-9, 46,000 additional holdings have vineyards destined to wines of quality. One will note a fall of more than one million holdings of vineyards destined to other wines, i.e. noticeably the same number as for wine-growing as a whole. (Table 2)

Holding having ...	EU-9		Development	
	1980	1997	Number	Percentage
... vines	2024.7	989.3	-1035.4	-51.1%
... vines (quality wine)	217.7	263.3	+45.6	+20.9%
... vines (other wines)	1778.5	742.9	-1035.6	-58.2%
... vines (table grapes)	99.4	46.4	-53.0	-53.3%

Table 2 : Changes in the numbers of holdings in EU-9

The CAP has generated this reconstruction, with incentives for extracting the old vines, improving the quality of the vines and the conversion of the vineyard. At the same time, the COM wine limited expensive interventions (distillation), which perversely encouraged high volume production. The revision of these measures, in particular at the time of the Dublin agreements (1984), allowed for the decline in volume and surface area. Thus the surface area in vineyards producing other wines increased in Italy until 1983 then decreased.

Woodland of agricultural holdings (H/02)

Trends 80-97 (EU-9)	Number of holdings : -30.2 % Woodland : -16.6 %	Trends 87-97 (EU-12)	Number of holdings : -22.1 % Woodland : -5.3 %
---------------------	--	----------------------	---

In 1998, European forests covered 136 million hectares, representing 44% of the total area, and 95 million hectares of forest were exploitable. Forestry industries employed approximately 2.2 million people.

In 1997, the European Union had 7 million agricultural holdings, 27% of which had woodland (i.e. 1.9 million holdings). The total woodland of agricultural holdings in the EU-15 was 23 million hectares, i.e. 17% of total woodland.

Two-thirds of this agricultural woodland was accounted for in almost equal parts by four countries, between 16% and 17% (Spain, Italy, Finland and Sweden). Including Austria (11.5%), this represents four fifths of the agricultural woodland. The forests of Finland and Sweden are very different to those of the Mediterranean countries and the definitions applied differ according to country. Moreover, total woodland represented 12% of total agricultural area in Spain, 19% in Italy, 50% in Sweden and 54% in Finland. Agricultural woodland accounted for a markedly greater proportion of total agricultural area in less favoured areas (19.5 % in less favoured areas compared with 6.2 % in other areas).

In 1997, almost all of the agricultural holdings in Finland had woodland. In Austria and Sweden, three holdings in four are of the same nature. These proportions are much higher than the European average (27%) which explains an environment exceptionally afforested.

Between 1970 and 1997, a quarter of the woodland in EU-6 had disappeared. During this period, Belgium lost half of its agricultural woodland. In doubling its woodland, the Netherlands was the only founding Member State in which agricultural woodland had increased.

Between 1987 and 1997, EU-12 saw a downward trend in the number of agricultural holdings with woodland. Though total woodland had declined to a certain extent, average woodland per holding with woodland had increased from 6.4 ha in 1987 to 7.8 ha in 1997.

With the addition of the three new Member States, agricultural woodland rose to 12 ha per holding with woodland in 1997 for EU-15.

In Sweden and Finland, average woodland per agricultural holding with woodland was 60 ha and 45 ha respectively. The corresponding figures for Greece, Belgium and Portugal ranged from 3 ha to 4 ha.

The Livestock Population

The Livestock Population (J)

Trends 75-97 (EU-9) Number of holdings : -52.1 %
 Livestock population (LSU) : +4.8 %

Trends 75-97 (EU-9) Number of holdings : -35.9 %
 Livestock population (LSU) : +1.2 %

Fewer dairy cows and more granivores

The overall size of the livestock population (converted into LSU) of EU-12 hardly changed over the decade from 1987 to 1997 and that of EU-9 only increased by 5% in twenty-two years (from 1975), despite the presence of over 3 million LSU in the new German *Länder* in 1997. The size of the livestock population is slightly lower for the last decade in the rest of EU-9.

This trend masks a variety of situations dependent on national circumstances, animal species and the periods observed.

Overall, the grazing stock population declined from 66 to 61 million LSU for EU-9 between 1975 and 1997 and from 72 to 70 million LSU for EU-12 between 1987 and 1997. It was 74 million LSU for EU-15 in 1997.

The entire cattle population has undergone a thorough restructuring. Dairy stock, which has been most affected by this decline, lost over a quarter of its population between 1975 and 1997 in EU-9, of which almost a fifth was between 1987 and 1997 in EU-12. The rest of the cattle population has had a moderate decline. The same applies to the goat population. The number of sheep increased by 11% in EU-12 over the same period.

The granivore population (pigs and poultry), most of which is reared subsoil, rose from 23 to 33 million LSU for EU-9 over 22 years, and from 36 to 39 million LSU for EU-12 between 1987 and 1997. It stood at 41 million LSU for EU-15 in 1997.

Pigs represented over 23% of the LSU of EU-9 in 1997 compared with 18% 20 years earlier. For poultry, the increase was from 8 to 12%.

The trend since 1987 shows that the share of pig LSU has increased in all the EU-12 countries except Germany, where it has declined by one percentage point (slaughterings in the new *Länder*). This ratio increased from 22.7 to 24.1% for pigs and from 10.3 to 11.6% for poultry.

Changes in the structure of the livestock population were marked by several events such as the introduction of milk quotas in 1984 and the reform of the CAP in 1992. The composition of the European livestock population at these dates illustrates the impact of these events (Figure 1).

Grazing stock: fewer cattle and more sheep

Between 1975 and 1997 the cattle population declined sharply in Denmark (-35%), the United Kingdom (-23%), Italy, France and the Netherlands (-16%), and in the old German Länder after reunification (-19%). In these countries, there was a total decline of about 10 million cattle LSU in just over twenty years (16% of the cattle population of EU-9 in 1975).

In EU-10, the number of dairy cows declined by 6.5 million (-26%) between 1983 and 1997, whilst the number of other cows increased by 3 million (+66%) and that the population of male cattle at least two years old fell by 0.7 million (-25%). The decline in the number of cattle not including cows (J/02 to J/06) was mainly due to the decline in the dairy herd replacement livestock since the number of bovine per cow (J/07 and J/08) did not decline between 1983 and 1997 in EU-10. It even slightly increased from 0.96 to 1.00.

The sheep livestock population benefited indirectly from the grazing areas released by cattle. Between 1987 and 1989/90, the sheep livestock increased sharply in Ireland (+79%), the Netherlands (+72%), Denmark (+42%) and Germany (+39% not counting the effects of reunification). The sheep herd increased by 11.3 million head, almost half of which was in the United Kingdom and a third in Ireland (Figure 3). The increase observed is correct but its apparent suddenness (between 1987 and 1989/90) is caused by the statistical effect¹. In Denmark, the absolute increase is 43 000 head (0.7 and 0.4 million in the Netherlands and the old German Länder).

¹ The 1979/80 and 1989/90 surveys are full surveys. The intervening surveys, by sampling, underestimate new phenomenon. Thus the changes seen between 1987 and 1989/90 have been produced in reality by the putting in place of milk quotas (1984).

More livestock on fewer holdings

Throughout European agriculture, the smallest holdings are disappearing and the size of the others increasing. Similarly, the number of livestock breeding holdings is on the decrease while the livestock population is increasing (Figure 2). Between 1990 and 1997, for example, three holdings out of ten with fewer than 10 LSU disappeared whilst the number of holdings of 100 LSU and over increased by an eighth.

Subsoil holdings specialising in granivores (FT 50 and 72) decreased by 40%, although their average area increased by 60%. The combination of these two factors resulted in stability in overall area terms.

Grazing livestock

With regard to dairy cow holdings, large holdings of 100 LSU and over are increasing in number (+12% in EU-12 between 1990 and 1997) but not very much in size. The average dairy livestock holding with over 50 dairy cows has stabilised at over 85 dairy cows per holding since 1993. However, the percentage of these large dairy herds within the dairy livestock population is on the increase. In EU-9, for example, in 1997 48% of dairy cows were in herds of 50 dairy cows and over, compared with 2% in 1975 (Figure 9). Between 1987 and 1997, the increase in the average size (+42%) of specialised dairy cattle herds (FT 1) was accompanied by an increase in their UAA of over 50% in EU-12.

The number of large holdings with at least 50 other cows also increased (+77% in EU-12 between 1990 and 1997) and constituted a growing proportion of the livestock population. In 1975 in EU-9, 18% of other cows formed part of these large herds, compared with 36% in 1997.

Granivores

The size of large holdings of over 100 LSU specialising in granivore rearing increased between 1990 and 1997 in EU-12, from 187 to 220 LSU in the case of pigs, and from 140 to 157 LSU for poultry. At the same time, the number of these holdings declined by 1% for pig holdings and 5% for poultry holdings. Granivore sections are disappearing from the largest livestock holdings with the result that livestock holdings are becoming more specialised as they become more concentrated.

Pig holdings with 100 breeding sows and over accounted for 72% of these animals in EU-9 in 1997 compared with 3% in 1975. The trend for poultry is less clear. The maintenance of a large number of holdings with low poultry numbers, especially in the south of Europe, and the highly concentrated pattern prior to 1975 provide an explanation for this.

More specialised holdings

An analysis of the trend, between 1987 and 1997 for EU-12, of the types of agricultural holdings and the corresponding UAA highlights specialisation among holdings (section 5 Farm types).

The number of holdings specialising in livestock breeding (FT 41-50) declined at a rate similar to that of the total of all holdings (24%). The number of holdings specialising in livestock rearing and beef and veal (FT 42), or sheep/goats (FT 44) however only declined by 3%. The former increased in UAA by a third and the latter by 15%. At the same time, mixed livestock breeding farms (FT 71 and 72) and milk and meat producing holdings (FT 43) became concentrated and specialised, or disappeared. This type of holding lost some 60% of its number. Their SGMs are declining and they are the only ones to do so.

With regard to holdings with various combinations of crops and livestock (FT 82), their number has fallen by a half while their average area has doubled.

The development of holdings specialising in sheep/goats (FT 44) means that they are becoming more numerous compared with dairy cattle holdings. They have had a marked development in Denmark, Germany, the Netherlands, Luxembourg as well as Portugal. In the first four cases, it is more a change in specialisation, whereas in the latter case, more generalised holdings have become more specialised.

The specialisation of livestock holdings is more widespread in the case of grazing livestock than for granivore holdings (Table 1).

The distribution of livestock between holdings specialising in breeding is fairly stable over time for both EU-10 since 1985 and EU-12 since 1987. However, regardless of the type of livestock, the population of mixed holdings has moved more towards specialised rearing, thus resulting in the specialisation of the corresponding holdings.

species	EU-10			EU-15 1997	types
	1985	1997	Trends (in point)		
Cattle (J02 to J08)	67.9%	68.8%	0.9	69.3%	41 to 43 livestock breeding specialising in cattle (milk, meat, mixed)
	4.8%	3.0%	- 1.8	3.2%	71 mixed grazing stock holdings

Labour Force

Labour Force (L)

Trends 75-97 (EU-9) Total labour force (AWUs): **-41.4 %**

Trends 87-97 (EU-12) Total labour force (AWUs): **-27.3 %**

Lower volume of total labour force

The total volume of agricultural labour fell sharply in all countries of the European Union between 1975 and 1997. Expressed in AWUs (Annual Work Units), the average decline for EU-9 exceeded 40% (-2.4% per annum). It even exceeded 50% in France and Luxembourg (Figure 1).

The decline was proportionately even greater between 1987 and 1997 for EU-12 (-27%, i.e. -3.1% per annum), particularly in Portugal (-47%, i.e. -6.2% per annum).

This decline in the volume of agricultural labour force was linked to the general economic trend and principally to (1) technological progress in a number of areas (mechanisation, selection of species, health plant products, fertilisers, etc) leading to an increase in productivity, and (2) the globalisation of trade. The combination of these two factors has led to a fall in the prices of agricultural products through (1) an increase in supply and (2) competition between guaranteed European prices and often much lower world market prices. This price decline has been difficult to reconcile while ensuring a fair standard of living for the agricultural community, which is one of the objectives of the CAP.

The decline in the labour force was also linked to the reduction in the number of holdings and the increase in their size. In the same technological environment and for economic necessity a smaller labour force was required for larger holdings. The decline in the volume of agricultural labour force therefore followed the pace of the disappearance of these holdings.

Essentially family labour force, but increasingly less so

European agriculture is still characterised by family holdings with little hired labour.

Family labour input accounts for the lion's share in the European Union, but this proportion has been declining. For example, it was 83% for EU-9 in 1979-80 compared with 81% in 1997. For EU-15, 80% of total agricultural labour was family labour in 1997. This proportion was lower in Denmark (60%) and the United Kingdom (62%), countries where holdings are essentially non-family businesses. It was higher in Finland and Ireland (95%).

Between 1979/80 and 1997 the average work time of the non-family labour force regularly employed (L/04) fell in EU-9 (-8%) except for in Germany.

As a result of agricultural restructuring, certain countries saw a marked increase in the volume of regular non-family labour force between 1979-80 and 1997. In absolute terms it doubled in Germany, though it declined as a proportion between 1989-90 and 1997 as a result of reunification. It increased by 50% in Belgium and the Netherlands and by 30% in Denmark. This trend was linked to the running of holdings as non-family businesses, either on a large scale or in terms of high value added activity, and thus labour intensive. In contrast, the volume of regular non-family labour input fell by nearly two thirds in Ireland, by half in Italy, by a third in the United Kingdom and by a fifth in France. This volume was comparable to the total labour force (Figure 3).

The non-family labour force employed on a non-regular basis played an increasing role (8% in 1997 compared with 6% in 1979/80 for EU-9) in the European Union in 1997, accounting for more than 9% of the total labour force EU-15. It was particularly important in the Mediterranean countries, representing up to 17% of the total labour force in Spain, in holdings veering towards permanent and market garden crops.

Total labour input excluding non-regular hired labour by age category*

* For 1979/80, a single age category covers workers from 35 to 54.

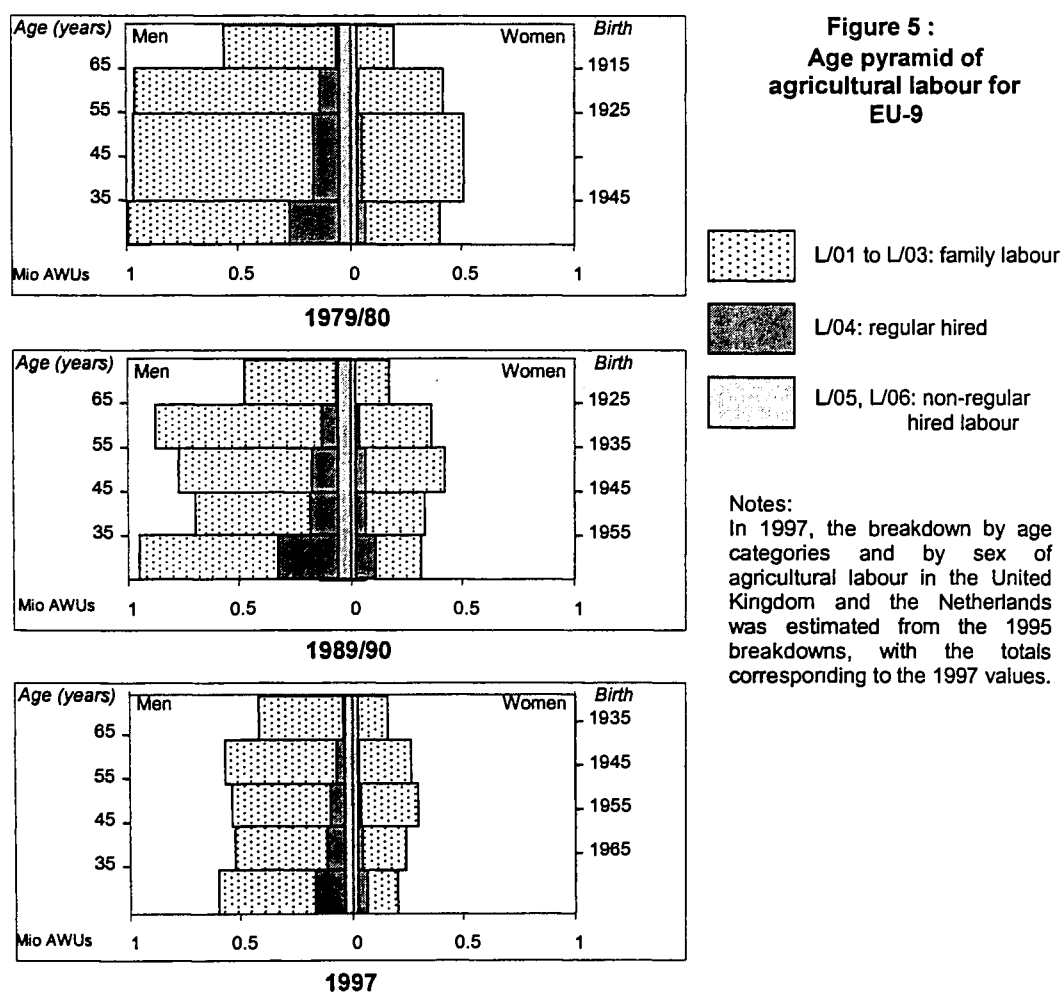

An older workforce in the South

In Italy, Portugal and Greece, the proportion of the agricultural labour force over 65 was greater (22%) than that in other European Union countries (11%) in 1997. This factor is explained by people continuing to work into old age on smallholdings.

The trend in the breakdown of the labour force by age category in EU-9 highlights two distinct periods (Figure 4). The first period, between the 1979/80 and the 1989/90 censuses, was characterised by an increase in the proportion of labour force under 35, which rose from 23.7% to 27.2% for EU-9. In Italy, however, it remained stable at around 17%. The second period, between 1989/90 and 1997, saw an increase in the proportion of labour force over 65.

The age pyramids (Figure 5) highlight the presence of two particular generations of farmers, the result of general demographic factors and non-specific agricultural demographic factors. The first generation of 1915-1925 emerged at the start of the Thirties. The second generation of 1945-1955 took over from the first generation in the 1980s. This trend was not in evidence for the female labour force. There was only a spike in participation in agricultural activity for women of 45 to 65, who no longer had as much family-based activity.

The ageing difference noted between the 1980s and the 1990s was due especially to the difference in the population composition by age category, i.e. the upwards shift of the pyramid. The erosion suffered by the various age categories was comparable over the two periods. Only the 55 to 64 age category experienced different erosion rates (-57% between 1980 and 1990 for the 1915-1925 generation compared with -51% between 1990 and 1997 for the 1925-1935 generation), which could be explained in part by a greater life span and the erosion of substitute income.

Working time

Part-time working in agriculture is widespread in the countries of the European Community (Figure 6). In 1997, part-time jobs represented nearly half of agricultural jobs (number of persons). Part-time working in agriculture is particularly developed in the Mediterranean countries. In Greece, Portugal, Spain and Italy, more than 70% of jobs are part-time, compared with 43% for the rest of EU-15. The high proportion of smallholdings in the south of Europe partly explains this contrast.

The proportion of full-time jobs in agriculture increased in most European countries between 1987 and 1997. There were declines only in Spain, Italy and Portugal on the one hand, and in the United Kingdom on the other. These situations are respectively explained by the considerable proportion of non-regular hired labour in the Mediterranean countries and the high proportion of regular hired labour in the United Kingdom.

The running of holdings as a non-family business is reflected in the absence of other gainful activity exercised by the head of holding. This is considerable in the Benelux countries where more than 80% of farmers had no other gainful activity in 1997 (Figure 7). This phenomenon however is limited in Germany, Austria, Finland and Sweden.

**Total labour input excluding non family labour employed on a non regular basis
by working time as a percentage of annual working time of a full-time worker**

Farmtype of holdings

Farmtype of holdings

Specialist crop products (1 to 3)

Trends 75-97 (EU-9) Numbers of holdings : +1.5 %

Trends 87-97 (EU-12) Numbers of holdings : -11.6 %

Specialist animal products (4 and 5)

Trends 75-97 (EU-9) Numbers of holdings : -31.8 %

Trends 87-97 (EU-12) Numbers of holdings : -23.1 %

Mixed types (6 to 8)

Trends 75-97 (EU-9) Numbers of holdings : -62.0 %

Trends 87-97 (EU-12) Numbers of holdings : -47.0 %

Grouping the specialisations in 3 main categories:

- crop products (types 1, 2, 3),
- animal products (types 4 and 5),
- mixed (types 6, 7, 8),

one notes differing developments according to the categories.

Referred to in the reduction in the total number of holdings (-28.8% in EU-9 between 1975 and 1997 and -23.6% in EU-12 between 1987 and 1997), the holdings specialised in crop products resist much better than the others to this general tendency to decline (respectively +0.1% in EU-9 between 1975 and 1997 and -11.6% in EU-12 in 1987 and 1997). The reduction in the number of the holdings specialised in animal products is slightly larger than the average. For the mixed farms almost 2 holdings out of 3 « disappear » in EU-9 between 1975 and 1997 and almost one in 2 in EU-12 between 1987 and 1997.

These developments in number translate themselves into relative parts by :

- Rather good stability of the number of the holdings specialised in animal products,
- A substantial increase in the part of the holdings specialised in crop products,
- A considerable decline of the others (table 1) for each aggregate EU-9, EU-12 and EU-15.

Looking at the specialisations in more detail (Figure 1), certain tendencies arise.

- The holdings specialised in permanent crops are amongst the vegetable specialisations, which disappear less.
- Among specialisations in animal products, the orientation on mixed bovine animals (43) alone explains a greater than the average reduction in the holdings specialised in animal products. One will note the staying power of holdings specialised in meat (42) and *sheep and other* bovine animals (44). This is explained partly by a reorientation due to the setting of milk quotas, and to a reassignment of the fodder surface area.

- The holdings of *in mixed livestock, mainly grazing livestock* (71) among mixed farms decline strongly.

The average annual developments of the standard gross margin by technico-economic orientation (FT) (Figure 2) explain well these tendencies. Indeed, types (71) and (43) are those, which lost most shares of SGM, while the crop products, the herbivores (except for orientation 43) and the granivores resisted better.

The period 1975-1987 differs from the period 1987-1997

The SGM/ha of specialised holdings in crop products and in mixed animal products doubled in EU-9, between 1979 and 1997.

Between 1987 and 1997, the SGM per ha of mixed farms increase half as quickly (+7%) than those of specialised holdings (+14%).

The participation of specialisations in the SGM total, also underline tendencies.

- The initial period is marked by a rise in economic and physical power of the holdings specialised in crop products. They rise from a total contribution in the SGM from 36.5% to 46.1%, to the detriment of the mixed farms. In particular, the type mixed farming (7) falls from 9.1% to 3.2% of the SGM and in type *mixed livestock, mainly grazing livestock* (71) from 6.7% to 1.7%.
- The second period sees the mixed farms disappear much more quickly than the specialised holdings crop products (0.7 times the average against 1.3 times the average for the holdings specialised in crop products).

These phenomena are more important in EU-12 than in EU-9. Restructuring among new members is more marked than in the remainder of the Community. Thus 1975-1987 can interpret itself as a period of reorientation and 1987-1997 like a period of consolidation of the structures (removals and consolidations).

Farmtype	EU-9			EU-12		EU-15	
	1975	1987	1997	1987	1997	1995	1997
In crop products	39.1%	49.3%	55.2%	51.1%	59.1%	55.5%	57.9%
In animal products	28.7%	28.2%	27.6%	22.1%	22.3%	24.9%	23.7%
Mixed types	32.1%	22.6%	17.2%	26.7%	18.6%	19.6%	18.4%

- (3) specialist permanent crops
- (41) specialist dairying
- (42) specialist cattle-rearing and fattening
- (43) cattle-dairying, rearing and fattening combined
- (44) sheep, goats and other grazing livestock
- (50) specialist granivores
- (60) mixed cropping
- (71) mixed livestock, mainly grazing livestock
- (72) mixed livestock, mainly granivores
- (81) field crops-grazing livestock combined
- (82) various crops and livestock combined

EU-12 (1987 - 1997)

Results by FT

The typology of agricultural holdings enables us to define their type of farming (TF). Their distribution in the European Union highlights the areas where farming systems have significant economic weight.

The total standard gross margin of agricultural holdings in a type of farming category portrays the economic weight of that category in a given zone. It is also more resistant to size effects than the number of agricultural holdings, and to intensity effects than utilised agricultural area.

The major production areas naturally provide some of this information, and the contribution of the various crops to the regional standard gross margins could be used to portray the situation. But the preponderance of one type of production does not represent that of farming systems. Some types of farming represent combinations of production, and mixed systems would not appear in such a representation. Some types of production are not clearly defined in the context of holdings and constitute a non-dominant activity, while others are highly concentrated in a few specialised holdings and only their economic size reflects their real significance.

Thus, in the case of viticulture, a simple representation of crop densities would emphasise the weight of the whole Mediterranean area and three other wine-growing regions (Aquitaine, Alsace and eastern Austria). If the relative figures for standard gross margins are used, they show that in the Mediterranean area the extent to which viticulture is defined varies. Viticultural holdings are specialised in France and certain regions of Italy, whereas in Spain, Greece and elsewhere in Italy they are less specialised and viticulture accounts for only part of their activity. In northern Portugal and Brittany the weight of specialised viticulture is considerable compared with other farming systems with smaller standard gross margins (Figure 3).

The contribution of a type of farming to the standard gross margin of a given region is then compared with the European average. If it is higher than the average, the type of farming has a higher than average weight and is a major feature of the region concerned. If not, the type of farming is not a major feature of the region's agriculture.

Four classes have been created in the maps on the following pages. The two lower classes refer to figures below the European average of the variable concerned (Figure 4).

The mapping regions are Eurofarm regions. Depending upon countries, they correspond to NUTS-1 (Nomenclature of Statistical Territorial Units), NUTS-2 or a combination of NUTS-1 and NUTS-2. The French overseas departments are excluded from the surveys and not represented.

Statistics in focus

To get straight to the heart of the matter and obtain an effective insight into the reality of the EU Member States, the series of documents entitled *Statistics in focus* offers you rapid and easy access to information on all current trends in Europe.

Statistics in focus: find out, understand and decide in confidence with:

- ★ harmonized, reliable and comparable data on each Member State of the European Union;
- ★ clear and concise comments and analyses;
- ★ charts and maps easy to understand;
- ★ the latest available data.

Statistics in focus is available as single copy or by subscription. Subscriptions are available for one single theme (except themes 7 and 9) or for the whole collection. *Statistics in focus* is available as printed version or as PDF-file sent by e-mail.

Prices on request from the Data Shop network (see end of the publication).

Eurostat essentials.....

Understand today's Europe to anticipate the future better

- ★ **Eurostat Yearbook:** a comprehensive statistical presentation supplemented by comparative data for the EU's main trading partners (CD-ROM version available).
- ★ **Money, finance and the euro: Statistics:** This monthly statistical document provides short-term series for a wide range of financial indicators such as interest rates, exchange rates, money supply and official reserves (quarterly CD-ROM version available).
- ★ **Europroms CD-ROM:** the only source of information in Europe to propose detailed and comparable data on output, external trade and the markets of several thousand industrial products.
- ★ **Services in Europe:** an overview of the companies active in the service sector including detailed sectoral, thematic and country analysis.
- ★ **Agriculture and fisheries: Statistical yearbook 1998:** the most important elements of Eurostat's publications on agriculture, forestry and fisheries in abbreviated form.
- ★ **Comext CD-ROM:** provides data on external trade on all goods imported into or exported from the statistical territory of the European Union or traded between the statistical territories of the Member States.
- ★ **Transport development in the central European countries (analysis of the trends for the years 1994 and 1995):** a statistical overview of transport in 11 central European countries, together with a review of data availability.
- ★ **Energy — monthly statistics:** With the help of graphs, these statistics cover updates of the principal statistical series characterising short-term trends in the energy sectors (coal, oil, gas, electrical energy).

New Cronos:

More than 160 million items of data in this macroeconomic and social database are available to all those who need high-quality statistical information for decision-making.

Regio:

Eurostat's database for regional statistics. Covers the main aspects of economic and social life in the Community; demography, economic accounts, employment, etc.

Comext:

The database for statistics on the European Union's external trade and trade between Member States. 11 000 products by year are covered with all partner countries (more or less 250).

Europroms:

The only source of information in Europe that supplies detailed and comparable data on output, external trade and markets of several thousand industrial products. It makes it possible to calculate in precise terms the domestic market for some 5 000 products for most EU countries.

For further information, contact the Eurostat Data Shop network or visit us on the Internet at: www.europa.eu.int/comm/eurostat/
