

ECU-EMS information

8/9 □ 1991 Monthly

FOR SEVERAL YEARS, EUROSTAT HAS CALCULATED CONSUMER PRICE INDICES FOR THE EUROPEAN COMMUNITY AS A WHOLE (EUR12).

The EUR12 consumer price index in national currencies is a weighted average of national indices expressed in national currencies, whilst the EUR12 consumer price index in ecu is a weighted average of national indices expressed in ecu, the weights in this case being the respective shares of each country in the total final household consumption of the EC, expressed in ecus. This second index therefore takes into account both national inflation and exchange rate variations with respect to the ecu. (See methodological notes at the end of this bulletin).

In the nine years between the creation of the European Monetary System (EMS) in March 1979 and the beginning of 1988, the EC inflation rate in national currencies was higher than that measured in ecu. This can be explained by the fact that the countries with high rates of inflation saw their currencies depreciate with respect to the ecu during this period.

From the beginning of 1988 until the middle of 1989 the Spanish peseta, the Italian lire and sterling generally remained strong against the ecu, despite the fact that these countries had relatively high inflation rates. This explains why the EC inflation rate measured in ecu was higher than that measured in national currencies during this period.

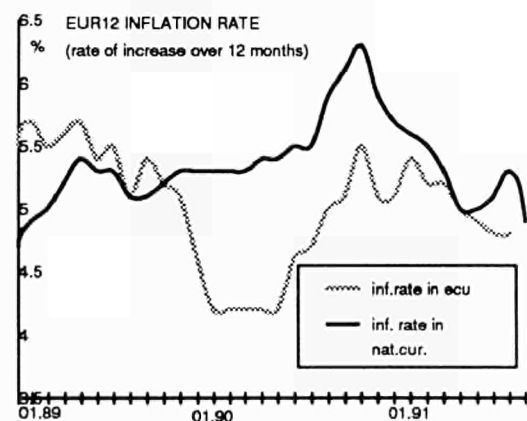

At the end of 1989 and the beginning of 1990, the slide in the EUR12 inflation rate measured in ecu was mainly due to the depreciation of sterling.

Sterling has been a member of the exchange rate mechanism of the EMS since October 1990, and the evolution of inflation rates in ecu and in national currencies have been similar since this point (see graph).

Between October 1990 and July 1991 the EC inflation rate in ecu has fallen from an annual rate of 5.5% to 4.8%.

European Community Inflation rates (annual averages of growth rate over 12 months)

	1985	1986	1987	1988	1989	1990
in national currencies	6.1	3.2	3.4	3.6	5.1	5.7
in ecu	5.3	3.4	1.8	1.3	5.3	4.7

-----	------------------

Contents

- I. A graph of the bilateral fluctuations of the ERM currencies.
- II. Yearly and monthly issues of ecu bonds.
- III. EMCF rate, interest rates on ecu deposits and yields on ecu bonds.
- IV. Last month's ecu bond issues.
- V. Consumer price indices in national currencies.
- VI. Consumer price indices in ecus.
- VII. Yearly, monthly and daily ecu exchange rates.

EXPLANATORY NOTES

Bilateral currency deviation (graph on page 3).

The various curves should be compared in pairs. To find the differential between two currencies, subtract the (positive or negative) values along the y-axis corresponding to each currency.

The graph is drawn with the curve of the strongest currency above that of the weakest. It shows therefore the relative position of each currency vis-à-vis the other currencies.

When two curves intersect or merge over a period of time there is no differential between the two currencies and their market exchange rate equals their bilateral central rate.

The graph is drawn within a horizontal band corresponding to the maximum 2,25% margin of fluctuation applying at any given moment to market exchange rates and the bilateral central rates of the ERM currencies, with the exception of the PTA and Sterling, which have a maximum authorized fluctuation of 6%. This band is divided symmetrically by a horizontal axis along which the points would be plotted if all currencies were at their bilateral central rate and there were therefore no fluctuations.

The daily market exchange rates of all currencies are compared with the relevant bilateral central rates and the differentials between the two calculated.

The maximum fluctuation between two currencies (with the exception of the PTA and Sterling) is shown within the band, symmetrical with the horizontal axis. The fluctuations of the other currencies in relation to either of the two currencies in question are shown within the maximum permissible fluctuation.

The curves are drawn by linking the daily points showing the relative positions of each currency.

Exchange rate grid (Table I).

The intervention limit rates fixed in the official grid do not always correspond exactly to + or - 2.25% (+ or - 6% for the peseta and Sterling) of the central rates, since for each currency pair (whose exchange rates are inversely proportional to one another) the lower limit of the one corresponds to the upper limit of the other.

Ecu bond issues (Table II & IV).

In table II, issues are recorded as at the payment date. This bulletin only covers international and foreign issues in ecus, including ecu issues offering the option of conversion into other currencies. Main source: International Financing Review

Table II shows, under the headings:

-Business sector and Governments: national issuers, both private and public.

-Institutions: the European Investment Bank and the Commission of the European Communities (EEC, ECSC, Euratom).

-Organizations: the specialist institutions of the United Nations, the World Bank, the Council of Europe, etc.....

Table IV shows detailed information of the latest known issues, whatever the payment date.

Interest rates and yields on ecu investments (Table III).

The interest rates for 1, 3 and 6 month and 1 year deposits are calculated on the basis of the Friday London market rates (source: Financial Times, London Money Rates, ECU Linked Deposit Bid).

The bonds are classified according to three types of maturities: under 5 years, from 5 to 7 years and more than 7 years. The redemption yields of ecu bonds are calculated each Wednesday from a sample of fixed interest bonds, denominated in ecus and listed on the Luxembourg Stock Exchange. These yields are weighted by the amounts in circulation. (source: Luxembourg Stock Exchange).

The monthly and yearly averages are the arithmetic means of these weekly interest rates and bond yields.

Operations rates of the EMCF (Table III).

The interest rate for transactions in EMCF (European Monetary Cooperation Fund) ecus, is the weighted average of the most representative rates on the domestic money market of the countries whose currencies make up the ecu basket. It is based on the weighting of the currencies in the ecu basket as derived from the ecu central rates in force. The rate thus calculated for a given month applies to EMCF transactions for the following month. In table 3, this rate relates to the month upon which the calculations are based and not to the (following) month during which it is used by the EMCF.

Consumer price indices in national currency (Table V).

The consumer price indices in the national currency of each country measure changes in the purchasing power of one unit of national currency spent in the country concerned.

Two composite indices are calculated, covering all the Member States of the Community (EUR 12) and the ten Member States with currencies participating in the European Monetary System exchange rate mechanism (ERM). (Although the peseta has been participating in the exchange rate mechanism since 19/06/89 and has been included in the calculation of the ecu since 21/09/89, it is only taken into account in the indices relating to the ERM which are included in this bulletin for data after 30/09/89.)

These indices are calculated as weighted arithmetic means (chain indices) of the national indices, the weighting for each Member State being its relative share in the final consumption of households of the group of countries in question (EUR 12, ERM), expressed in purchasing power standards, at current prices and purchasing power parities.

At the foot of the table, the average weighted fluctuations around the mean and the minimum are given for the same groups of countries, with the same weightings. (These are calculated as weighted averages of the absolute fluctuations in relation to the mean and the minimum respectively). They show the degree to which price movements in the Member States in the Community converge.

Consumer price indices in ecus (Table VI).

For each country the index of consumer prices in ecus is calculated by dividing the national consumer price index by the average movement of the national currency in relation to the ecu during the month. It measures the change in the purchasing power of one ecu in the country concerned.

Three composite indices are calculated, covering all the Member States of the Community (EUR 12 and ECU), the 10 Member States participating in the European Monetary System exchange rate mechanism (ERM). Although the peseta has been participating in the exchange rate mechanism since 19/06/89, and the peseta and the escudo have been included in the calculation of the ecu since 21/09/89, these two currencies are only taken into account in the indices contained in this bulletin for data after 30/09/89.)

These three indices are calculated as weighted arithmetic means (chain-indices). The weightings are defined as follows: for the EUR 12 and ERM indices, the relative share of each Member State in the final consumption of households for the group of countries in question (EUR 12 or ERM), expressed in ecus at current prices and exchange rates (annual weighting). For the ecu index, the relative share of each Member State's currency in the calculation of the ecu (monthly weighting).

Ecu exchange rates (Table VII).

The exchange rates for the ecu against the national currencies of the Member States of the Community, the USD and yen are shown as annual averages, monthly averages (for the current year), and daily rates (for the latest available month).
