Commission unveils information market policy programme

New companies in a brave, new Europe

A true European company, incorporated in Luxembourg, built on a green field site, with vice presidents from at least five Community countries, financed by capital from across the Community. That is the means.

Targeting for 20 per cent of the European market in 2 micron CMOS chips for system houses. That is the aim.

Away with the "every country must have its own champion manufacturer". That is the concept to be avoided.

Dr Robb Wilmot, chairman of STC and ICL, Britain's largest computer manufacturer, has concluded that the supply side of the economy needs a radically new approach. "IBM Europe often claims to be more European than most of our own companies... Critical mass is hard to come by in Europe because of the fatal desire of every country to have its own national champion, and bigger countries to have several believing that it creates competition. This crowding out process means that it is very difficult for any European company to achieve more than 1 or 2 per cent world market share." He estimates that a major com-

Continued on p 2.

The European Commission has announced a new programme to unblock or free up market related aspects of the new information technologies. The initiative responds to the call of the European Council meeting in Brussels on 29 and 30 March for the realisation of a common information market as a specific Community goal.

The Commission's Communication to Council¹ of 21 November on "a work programme for creating a common information market" underlines the key role of information for trade and industry, the problems faced by the European information market and the urgent need to create the right market conditions for advanced European information services.

Europe, traditionally strong in the press and publishing sectors, produces fewer than half as many data bases accessible online than the U.S. The turnover of European providers of electronic specialised information is estimated at only one fifth of that achieved by their U.S. counterparts. Current market conditions are such that, with a few rare exceptions, most of the online European information service suppliers are unable to recoup their investment costs without state support.

Previous Community initiatives (such as ESPRIT, INSIS, parts of FAST and the action programme on telecommunications) are, how-

ever, primarily concerned with the technology rather than the information aspect of new information technologies (NIT). The work-programme introduced by the Communication aims at filling this gap by initiating actions to strengthen the competitiveness and marketing

capabilities of European information services; reduce the uncertainties and obstacles to the development of the market; stimulate demand; and promote convergence of policies within the Community in view of developments in the international field. The outcome of

Continued on p 2.

M Michel Poniatowski, président de la commission de l'énergie, de la recherche et de la technologie du Parlement européen, s'adresse aux spectateurs à l'exposition Europe 2000, qui eut lieu à Strasbourg en Octobre.

New companies from p 1.

pany needs at least 5 per cent of the global market to survive.

Wilmot's second key point is the need for organisational capability to win globally. The new company European Silicon Structures, ES², will have products that can be produced in higher volumes in foundries across Europe. Dr Wilmot suggests this mechanism may only be applicable to certain parts of the IT industry, where extreme economy-of-scale sensitivity or the market needs standardised products. For such sectors he is encouraging the Community and national administrations to create the concept of a Qualifying European Enterprise (QEE) which would benefit from special legislation, equalised tax treatment and a re-think about how governments consider subsidies.

Information providers

The benefits of establishing a company across the Community dimension are at least as critical for companies trying to respond to the market in Software. A few examples of this are given in the article on networks page 8 of this issue.

The need is even more serious when the market in Information-ware is considered. On how the Community manages to maximise the intellectual and commercial potential of its 320 million citizens will depend the relative prosperity of the next generation.

A teleshopping system exists in the USA. Who will supply the multilingual computer translation interface for a machine like that described on page 3 to function across Europe? Automatic translation techniques now ensure 80% or better accuracy. Yet even at the level of the hum-

ble telex, there is no translating interface provided by PTTs or commercial companies to ease intra-European communications.

For European Value Added Networks to flourish, much of the electronic information presently available and a good deal more yet to be created needs to be accessible to the widest possible audience.

This type of operation would perhaps need the European Commission to act as an honest broker between providers of the different information services. In the past the Commission has helped bring firms together across Europe, both in the DOCDEL experiments base production and also in the framework of ESPRIT.

A recent **Midterm Review of Espirit** found 97.5% of participants asked thought this R & D programme fostered European cooperation. The Review Board recommended progress on downstream projects.

New information services will need a new financial, regulatory and network infrastructure which will encourage such ventures to be built on a European base. It will also need new mechanisms for bringing together interest groups across Europe who want to cooperate to create new value added services. This is the concept behind the suggestion for an Information Market Programme for the Promotion and Introduction of Common Technologies, IMPACT (see IM no 40, pl).

If the going looks tough now, as Dr Wilmot can testify, it will be even tougher in the next few years unless a start is made on building a true Common Market for information.

New programme from p 1.

the analytical work done by the Commission so far shows that priority attention is required in eight areas:

1. Role of the public sector (both in supplying information and supporting information services)
2. Legal aspects (including intellectual property, data protection, health and safety regulations, new problems created by NIT services, etc.)
3. Economic aspects (including improved statistical, technical and market trends information, research on socio-economic aspects of information and communication, etc.)
4. Removing barriers to information flows (harmonisation of standards, improved telecommunications and postal facilities)
5. Use of and demand for advanced information services (stimulation of use and demand, improved access to NIT services for non-expert users, educational campaigns)
6. Convergence of national and Community policies (identification and pursuit of Community inter-

ests in external relations, closer links with less industrialized countries)

7. Fiscal and commercial environment (accounting rules and practices, fiscal and custom treatment, advertising rules on electronic information services)
8. Participation of the less favoured regions (LFRs) in the advanced information services market (action plan to reduce the development lag of Community LFRs with respect to the use and supply of advanced information services and the required telecoms infrastructure).

A special Member State advisory group, consisting of senior representatives of competent national ministries, will be established to help the Commission carry out this programme and coordinate relevant activities in the Member States. The Commission will present a report on progress within one year following its Communication.

Teleshopping information kiosk

Sony or Pioneer, a disk which can stock some 54 000 images, a 42 cm colour monitor... and stereo sound. A small micro computer drives the system. A touch sensitive flat keyboard enables the user to indicate his choices of the range and specifics of his purchase. A built in clock keeps track of operations.

Telecommunications is possible via an integrated modem which permits the terminal to be attached to a distant computer host. To facilitate payments, the user's credit card or chip card can be debited electronically on the machine. A printer can be attached under the table which gives the purchaser a record of all the

Credit card slots in on the left.

On a trip away from home and you want to order some chairs for the kitchen? All this may be possible from the comfort of your hotel or an airport lobby with a new teleshopping kiosk made in France.

Much like a telephone booth, the TVI (Terminal de Vente Image or Image sales terminal) comprises a videodisk reader for Philips,

goods he has bought, together with details of delivery dates.

Teleshopping is just one of the possibilities for this versatile machine. It could also be set up for database interrogation or public information supply.

Materials databank user guidance system

The European Commission DG XIII has published a call for tenders for a user guidance system to be developed in conjunction with the materials databanks Demonstrator Programme (IM 40 p7).

This will provide a uniform online appearance for a number of cooperating databanks, as far as the user is concerned. The general objective of the user guidance system is to contribute to the

removing of some of the basic obstacles present for access to information which is partly administrative and partly technical in nature. The contractor would develop the system to give the appearance of a coherent information service in co-operation with the databanks cooperating in the project.

Artificial intelligence

A workshop organised by the European Commission, DG XIII, was held at Luxembourg on 13 September to bring together both technicians and users of artificial intelligence as a means of reducing the skills and expertise necessary for accessing online information systems. The workshop helped identify requirements and opportunities for AI based systems, summarized practical

experience of such system and their implications for database construction. A fourth session related to specific applications for scientific, medical, legal patent business trade and economic information. The proceedings will be published in the form of a book.

Dialoguez avec Saphir

Destiné essentiellement aux non-informaticiens, Saphir est un véritable interprète qui permet à n'importe quel utilisateur d'interroger des bases de données sans en connaître le langage d'accès particulier.

Premier logiciel de ce type en langue française, Saphir est un analyseur du langage naturel d'utilisation extrêmement souple puisqu'il offre la possibilité d'utiliser une syntaxe très simple (pratiquement celle du français) et de dialoguer ainsi avec le système de ges-

tion de bases de données dans la base et leur codification.

Interprète intelligent, Saphir est capable d'engager un dialogue avec l'utilisateur, afin de lever ambiguïtés et incertitudes (telles que fautes d'orthographe) et suggérer, en cas d'imprécisions, différentes interprétations possibles.

Compact optical disc memory – a blow to online data bases?

New developments in optical storage media are currently providing some of the most promising innovations for the improvement of cost-performance relationships in the office automation and information management-systems fields. CD ROM (compact disc read only memory), one of the most important of these, offers tremendous potential opportunities.

What is CD ROM?

CD ROM is an extension of CD audio technology. Thus, discs are potentially low cost. In addition, they provide mass storage: one disc has 550 MB data capacity. Being small and lightweight, discs are transportable and therefore offer an alternative means of database distribution to online services. Linked, via a suitable interface to a personal computer, a CD ROM player and disc allow an end user access to databases without the cost constraint of variable charges (such as telecommunications tariffs and hosts' time-related access prices).

With these cost-, storage- and distribution-characteristics CD ROM is widely considered to have important applications potentials, notably in publishing and library documentation/archiving. The CEC, aware of these potentials and keen to promote the early introduction of the technology with new information services, has included CD ROM-based applications as eligible for selection for part-financing within the recent Call for Proposals.

Strategies

Closer assessment of the future impact of CD ROM on the European information

industry will take into account a number of factors likely to affect the rate and extent of penetration and use. Amongst these are: standards problems; the product commercialisation strategies of manufacturers and the responses of existing online hosts.

Philips and Sony, the principal firms involved in developing CD audio technology, agreed a standard for the CD player and disc. These same standards apply to

for CD ROM. Recently, agreement has also been reached on the error correction codes required to ensure integrity of the data. Manufacturers have not finalised their views on the required CD player-to-pc interface; indeed, each seems to be taking its own path.

On the hardware side, the National Information Standards Organisation in the USA and the CEC in Europe are aware of the lack of standards and concerned that agreement between interested parties should be developed. At this stage however, it is unclear how these bodies intend to influence future developments to avoid standards-related constraints impacting market development and end user acceptance.

More worrying, there are no standards for information retrieval software. Manufacturers and specialist software houses active in developing CD ROM applications recognise that existing retrieval system packages are inadequate. Hence new software is being written. Since most manufacturers and software specialists work independently, new software products tend to be incompatible.

Advantages

One attractive feature of CD ROM is that it uses the same technology as CD audio. Hence manufacturers' investments in production facilities are minimised. Given the capital costs involved, this is an important economic advantage.

But demand for CD audio players and discs is increasing rapidly. This could create undercapacity in production facilities for CD ROM in the short-term. Alternatively manufacturers, having risked capital resources to create demand for CD audio, may be reluctant to invest further in CD ROM hardware production while the demand trend for CD audio continues upwards. This too could be a source of delay in CD ROM market development.

For retail costs of CD ROM players and discs to fall substantially, mass production is needed. So there is a strong tendency amongst manufacturers to seek out clients willing to buy in CD ROMs for large-scale production runs. This approach does not favour dealing with firms purchasing only small

quantities. Yet, to help early and widespread dissemination, just such an approach may be needed. Lacking in the current market is a supply of suitable applications projects. Small companies with specialist software skills who have identified particular niches of demand for new and innovative CD ROM-based services, but who have only limited capital resources, are likely to be some of the manufacturers' best clients in the next 12-18 months.

Skimming the market

CD ROM provides for an additional means for the distribution of databases. This could result in a trade-off between different media by information providers.

One danger lies in the 'cream-skimming' of the traditional online industry, still mainly oriented towards scientific and technical users. In response to this erosion to its traditional client base, will online services be directed more to the still untapped demand and revenue earning potential of the business sector?

UK company data on Data-Star

Data-Star, the European online service has added the ICC UK Companies file to those it already holds on West Germany, Austria and The Netherlands.

Almost 1 million companies

There are almost one million companies registered in the UK and all of these are in the Data-Star file. Included are the basic details for each company, name, address, directors, when formed etc. For the 60,000 largest companies, annual accounts, key ratios and other significant data are included, often going back for seven years for comparison purposes. All data for a company is in one easy to understand listing.

Produced by ICC

The data is produced in computer form initially by Inter Company Comparisons (ICC) who have for many years been the leaders in the UK in merchandising and evaluating company data. The file will be updated weekly to keep users fully informed on new companies, recently lodged accounts, changes in directors etc.

Future developments

Further developments will include: increasing the number of companies with accounts data to over 120,000, more detail on each company, and shareholders of over 0.25% of stock for listed companies.

Availability

Available to all Data-Star users, the service will cost significantly less than other means of acquiring such data.

Please send me details of

Japanese database information is being regularly accessed in Germany on the type of equipment used domestically in Japan. The West German group GID have signed an agreement with JICST, the Japan Information Center of Science and Technology which gives them a password, printer and other terminal equipment. More than 4 million documents are stored in the field of science and technology.

Initially data is being received mainly in Japanese characters. It is planned that a simplified version of the text, at first comprising titles in English, will be made available. Japanese officials see the agreement with Germany and other trading partners as a means to rectify the information imbalance with the West.

The scandal of the national networks

Recently the European Information Market Development Group tried out a piece of communications software. It worked perfectly well in its country of origin, one of the Member States.

Alas, many of the sophisticated operations, designed to make life easy for online information retrieval, could not be easily implemented from Luxembourg.

The same story repeated itself a few days later, this time in Strasbourg. There the telecommunications software on a portable micro – which worked without problem in the United Kingdom – was impossible to use with the French network. The failure was more poignant as the micro was supposed to be demonstrating one of the ESPRIT projects. Instead of using the French network, the operator used some (probably illegal) socket spades and had to place a costly, direct long distance telephone call.

Why?

The fact of the matter is that in the post-Euronet era, Europe's interconnected packet

switched networks each conform to European (CCITT) standards which allow many possibilities for separate interpretations. In practice, each network plays its own variations on the theme of the European norm. Some seem to have composed symphonies. Too bad for the travelling salesman!

Next to the "demonstration" in Strasbourg was an exhibit on European standards. The truth is that each network seems to have its own European standard. While any micro can work with an acoustic coupler as a dumb device, problems arise as soon as more "user-friendly" equipment or software is installed.

Hosts have also contributed to the confusion. Some have set their own parameters to the network in such a way that otherwise time-saving software is rendered almost useless. For their own commercial good, hosts need to establish standard procedures welcoming all types of users.

For logging on to a computer host, a user has normally first to access a data

TELEPHONE NO

network. He does this by dialling a certain telephone number and identifying himself by means of an NUI (Network User Identifier), a series of numbers and letters. He then adds the address of the host (Network Users Address). It is to avoid this complicated process that micro computer software packages were developed.

No single procedure for this simple logging on process is the same in Europa. Every network has its own combination of entering these two often inordinately long strings of numbers and letters as table 1 demonstrates. Besides this complication, parameters of the networks – a subject of arcane technicality to the average user – are different. And some networks, for example, require voltage to be supplied on one of the pins of the RS 232 plug, others don't.

Any number of possibilities are provided to block prevent communication. When

this happens the user may receive a help message from the network such as LIB-INV.

Hardly a clinical diagnosis of an unduly complicated problem.

It would be encouraging to hope that the PTTs would reform this state of affairs, themselves. In other words, return the state of advancement to that of a few years ago when, with Euronet, there was one access procedure for all participating countries.

At the very least the lesson should be learned. This is a level of confusion the customer can very well do without. More powerful networks being brought into use over the next few years must not suffer from the same short sighted problems.

A higher level of cooperation is needed from the people who have not yet brought us the European postage stamp.

A you have problems with your network, please let us know; we might be able to help.

Spanish coordination

Representatives of the European Commission, DG XIII, including information market director C Jansen van Rosendaal, met with Spanish representatives of ministries, universities, libraries, databank producers and users on 16-17 October

in Madrid to coordinate activities prior to the entry of Spain into the Community in 1986.

Spanish representatives meeting in Toldeo were also given a presentation of the Apollo document delivery system.

Table of logon procedures

To log on, users dial a network node and receive a network tone. After that the procedure varies from country to country. The following table, for indicative purposes only, gives some idea what the user must then do. Procedures may be subject to change. Check with your local PTT!

Country	Procedure
Austria	.& NUI<NUI>& <PASSWORD>& Ø<NUA>&
Belgium	<NUI>-Ø<NUA>&
Denmark	& & SP & N<NUI>-A9<NUA>
Federal Republic of Germany	.& NUI<NUI>& <PASSWORD>& Ø<NUA>&
France	Ø<NUA>P (or D) <NUI>
Greece	<NUA><NUI>
Ireland	...& NUI<NUI>& <PASSWORD>& Ø<NUA>CR
Italy	N<NUI>-<NUA>&
Luxembourg	?N<NUI>-Ø<NUA>&
Netherlands	N<NUI>-<NUA>&
Portugal	H & <NUA>P (or D) CTT-<NUI>&
Spain	Terminal identifier & <NUI>; <PASSWORD>& 2704<NUA>&
Sweden	Terminal identifier & <USERNAME>: 68 (or 69 or 71); <PASSWORD>; <NUA>&
Switzerland	.& NUI<NUI>& <PASSWORD>& Ø<NUA>&
United Kingdom	&A2 (or other terminal identifier) & N<NUI>& A9<NUA>&

& = carriage return; NUI = network user identification; NUA = network users address (the computer to be contacted); the brackets <> indicate that the user must tap in the corresponding strings of numbers or letters; the brackets () indicate that the user has a choice of two or more possibilities depending what he requires.

Commission listens to views on financial information services in Europe

The financial information market is one of the fastest growing areas in online electronic information. Services supplying this information in Europe are, however, far from smug. Europe is experiencing slower growth than USA and there are a number of important braking factors on efforts to supply fast and efficient information and decision making systems to the financial market.

Some 25 organisations including European and American banks, financial information services and members of Community in-

stitutions met in Luxembourg on 1 October on the invitation of the European Commission.

The aim of the "workshop" was to identify possible areas for Community action to encourage the development of this specialised sector. Among those who attended were representatives of Citibank, Kredietbank and Société Générale de Banque from Belgium, NatWest, Standard and Chartered, Midland Bank from the UK, the Bank of Greece and Scandinaviska Enskilda Bank, SWIFT, the interbank network, together with such services as I P Sharp, Telekurs, Chase/Interactive Data Corp, Cisi Wharton, Telerate.

As the financial market is a 24 hour world market the meeting was directed at impediments in present structures rather than a debate on US/European division of the present market. Six main

areas of action were agreed on by the participants.

1. The PTTs should be encouraged to provide much more flexible services. Participants strongly expressed the view that current PTT regulations are major reason

to be initiated in regard to PTT activities.

2. An enhanced degree of de-regulation would have a major influence not only on financial services themselves but would also create new opportunities for informa-

causing European information services to be held back and to lag behind the North American market. Some PTTs, it was noted, were beginning to offer their own financial services and it was recommended that proper "rules of the game" should

be identified three examples where information services could benefit: liberalisation and integration of capital markets; freedom of establishment and harmonisation of means of payments and settlements. Stock ex-

Legal Observatory viewpoint

The first meeting of the Commission's Legal Observatory for the European information market took place in Luxembourg on 14 October. It identified three priority issues for study over the coming year:

1. access to information held by the public sector;
2. inconsistencies in legal rights and obligations applicable to different categories of information providers; and
3. legal problems related to teleshopping and telebanking.

It was further decided that the issue of the legal protection of computer software

and data bases content be examined in the light of the Commission's Green Paper on Copyright that will come out early next year. The meeting also discussed the specific issue of the inclusion of legal persons in data protection legislation, on which there were contributions by the International Chamber of Commerce and legal experts from the Community Member States. It was recommended that no Community action be taken before there was concrete evidence of market distortions or other discrepancies from such inclusion.

change information, for example, is one area which is less developed in Europe due to lack of integration of capital markets.

3. Public administrations are often sitting on valuable raw data which should be made available to European information suppliers. With a view to creating information for the international market, it would be helpful if guidelines for a common approach to the conditions under which this material should be offered could be produced at the Community level.

4. While recognising the work being done on standards generally, the participants recommended that urgent attention was needed to be paid to application-level information format standards. This urgency arises from the increased number and variety of services finding their way onto the users desk and work environment. Community-level action to promote information format standards both for the end-user and in making raw material available for information suppliers would be particularly valuable.

5. Closer collaboration could be encouraged between universities and finan-

cial information services to help provide socio-economic data or direct collaboration on services. Such cooperative ventures had played a positive rôle in the creation of North American services.

6. Financial information services in Europe have achieved only a third of the penetration of those in the United States. Major information suppliers have a clear picture of the need for their services, but there are many areas of unexploited potential for example, among small businesses. Improved understanding of the demand structure would greatly assist in the opening up of the European market and bring the benefits of financial information services to a wider range of organisations. Community action to promote better understanding of demand and awareness would help stimulate the growth of the European financial information services market.

The Commission would especially like to hear from other firms in the market who are experiencing obstacles to growth that could be tackled at a European level.

The NUI authorises you to connect to the public data network in your country. Rent a modem from the PTT or buy one. At the same time make a choice of hosts, databases and databanks using DIANE GUIDE.

2. Sign an agreement with the respective hosts where the chosen databanks and databases are available for online searching.

3. You will receive a password from the host(s) which authorizes you to search the chosen databanks and databases.

4. These are all the requirements you need. The PTT and hosts will invoice you for your use of the network and the databases/databanks respectively.

General information

- To obtain general information (lists of hosts, PTTs, intermediaries, user groups, etc.), write to:

Euronet DIANE, 177, route d'Esch, L-1471 Luxembourg

- For specific questions or problems:

Telephone: Luxembourg (+352) 488041, Telex: 2181.

The Euronet DIANE team will call you back to save telephone costs.
