Educational attainment levels in Europe in the 1990s - some key figures

Laurent Freysson

Education levels are continuing to rise in all the countries of the European Union, and have been for some thirty years. According to the results of the European Union Labour Force Survey, over 71% of 25- to 29-year-olds have obtained an upper secondary education qualification compared to 48% of 50- to 64-year-olds.

However, in the 18 to 24 age group, one young person in five has left education with only the level of compulsory full-time education; the proportion is over one in four in Spain and Italy, and near to one in two in Portugal.

Moreover, the number of higher education graduates continues to increase. At present, they represent over 20% of 25- to 64-year-olds in the European Union. This proportion varies from around 10% in Italy, Austria and Portugal to almost 30% in Sweden and Finland.

Explained in part by a desire to guard themselves against socio-economic conditions which until now have been less than favourable to the employment of young people, and especially young people with the lowest qualifications, higher education remains an attractive option for many in that the unemployment rate for low or unskilled workers is often double (or even triple) that for higher education graduates.

Young people: increasingly better qualified than the previous generation

It is now well established that the general trend throughout the European Union towards remaining in education is not a cyclical phenomenon. On the contrary, it is the result of a structural phenomenon which has led successive generations to attain higher levels of education and training than previous ones, as is shown by the percentage increase in people with upper secondary education qualifications calculated for various age groups (Table 1).

Thus in 1999, only 47.9% of European citizens aged 50- to 64-years had completed upper secondary education, whereas among 25- to 29-year-olds, 71.4% had attained the same level.

Although Greece, Spain, Italy and Portugal had the lowest education levels (under 50% compared with a 60% average), these countries have seen the greatest increases, with over double the number of persons with upper secondary education qualifications among young people than in the older age groups.

It seems therefore that the differences in education levels of the various Member States are gradually being reduced.

Table 3: Percentage of 18- to 24-year-olds not in education and low-skilled, 1999 (Austria) to over 25% in Italy and Spain, and as much as 45% in Portugal.

Table 1: Percentage of persons with upper secondary education, by age group, 1999 in %

Educational attainment levels also continued to increase during the 1990s, as shown in Table 2.

Table 2: Percentage of 25- to 64-year-olds with upper secondary education, 1992-99

However, over one fifth of young persons leave school on or before completion of compulsory education.

Despite the fact that young people are increasingly better qualified, almost one in five leaves the education system, at best, on completing lower secondary education, which in most cases is the end of compulsory education.

This proportion varies from 7% for all 18- to 24-year-olds in Sweden (the figure is around 10% in Finland, Denmark and Austria) to over 25% in Italy and Spain, and as much as 45% in Portugal.

In general, the proportion of low-skilled young persons is higher among males, except in Germany and slightly higher in Austria.

Table 3: Percentage of 18- to 24-year-olds not in education and low-skilled, 1999

Higher education graduates

In the European Union, the proportion of higher education graduates is currently over 20% for 25- to 64-year-olds. The situation is far from uniform since the figures range from 10% in Italy, Portugal and Austria to almost 30% in Sweden and Finland.

Despite the fact that in terms of attainment level, women are catching up on men, (or even sometimes overtaking them) the proportion of male higher education graduates is still higher throughout the EU and in most Member States. However in Belgium, Denmark, France, Portugal, Finland and Sweden, the scale is tipping in favour of women.

(1) 1997

In general, higher education graduates are better equipped to guard against unemployment. Throughout the 1990s, the unemployment rate for unskilled or low-skilled workers in the European Union has remained roughly double that for the higher education graduates (Table 5).

In reality, Greece is the only country where the unemployment rate is virtually identical for the two categories of education levels, and the situation in Italy and Spain approaches that of Greece. Moreover, in some countries such as Denmark, Portugal and Sweden, the disparities seem to be declining, whereas in Belgium, Germany, France, the Netherlands and Austria, the gap seems to be widening. With inadequate education and welfare systems or a labour market less suited to certain groups in society, the low or unskilled often have few chances when competing against graduates.

Table 5: Ratio between the unemployment rate of low-skilled workers (ISCED 0-2) and that of higher education graduates (ISCED 5-6) - 25-64 yrs, 1992-1999

### Order form

I would like to subscribe to Statistics in focus from (1.1.2001 to 31.12.2001):

1. **Formula 1**: All 9 themes (approximately 140 issues)
   - Paper: EUR 360
   - Language required: DE  EN  FR

2. **Formula 2**: One or more of the following seven themes:
   - Theme 1 'General statistics'
     - Paper: EUR 42
   - Theme 2 'Economy and finance'
   - Theme 3 'Population and social conditions'
   - Theme 4 'Industry, trade and services'
   - Theme 5 'Agriculture and fisheries'
   - Theme 6 'External trade'
   - Theme 7 'Environment and energy'
   - Paper: EUR 84
   - Language required: DE  EN  FR

Statistics in focus can be downloaded (pdf file) free of charge from the Eurostat web site. You only need to register. For other solutions, contact your Data Shop.
