

Inland waterways freight transport - quarterly and annual data

After recovery in 2010 another renewed decline for inland waterways transport in 2011.

In brief

- EU inland waterways transport performance in millions of tonne-kilometres (TKm) in 2011 is 4.9% lower than in 2010.
- Total EU inland waterways transport declined in the fourth quarter of 2011.
- In 2011, the weight of goods transported on EU inland waterways increased for national and international transport.
- Container transport decreased by almost 11% in the fourth quarter of 2011.
- ‘Metal ores and other mining and quarrying products; peat; uranium and thorium’ (NST2007 – goods group 03) account for the highest share in total goods transport in 2011.
- Transport performance of ‘Self-propelled barges’ responsible for more than 50% of the total in the EU.
- ‘Self-propelled barges’ are mainly used for goods transport in the Benelux countries and Germany.

Compared to the height of the global economic crisis a recovery is observed until the third quarter 2010 for inland waterways transport performance in TKm of EU ports (transit transport in Bulgaria excluded).

However, after the fall of about 9% between the fourth quarter of 2010 and the first quarter of 2011, transport performance recovered again in the following two quarters of 2011 followed by another drop of more than 10% in the fourth quarter of 2011.

These ups and downs confirm that the recovery of European port activity is relatively fragile, but at a higher level compared to the years of the global economic crisis.

Despite these fluctuations, the EU total in terms of transported volumes (in 1 000 tonnes) showed relatively stable values for all four quarters of 2011. The transported quantities in the European Union were higher than before the global economic crisis.

(²) Growth rates for national and total have been calculated excluding data for Italy, Lithuania and the United Kingdom

(³) Annual transit transport was only partially available in 2008

Source: Eurostat (online data code: www.go.actygo)

In 2011, national transport performance in TKm increased by 6% while international transport performance decreased by nearly 4%.

However the weight of goods transported on EU inland waterways increased for both national and international transport.

Though, this was the case for the EU total transport volume. After an increase of more than 14% from 2009 to 2010, it increased again by more than 7% between 2010 and 2011. This was mainly due to a growth of national transport volumes in all EU countries except Slovakia. International transport volumes only increased in Belgium and the Netherlands showing similar rates to national transport.

The increase in total transport performance in Belgium, the Netherlands, Poland and Finland could not compensate for the downturn in all other EU countries listed in table 3.

Transport performance in TKm for national transport rose in all EU countries while it decreased for international transport. Only Belgium and the Netherlands were an exception, recording growth for both national and international transport performance. But at EU level as well as in all EU countries except France, Poland and Romania, inland waterways transport contribution to the total international trade of goods is more important than its contribution to national transport of goods. Germany (55 billion TKm) recorded the highest transport performance, followed by the Netherlands (46 billion TKm).

Container transport at the level before the global economic crisis

Figure 2: Quarterly transport performance of containers on inland waterways in EU-27⁽¹⁾ - 1 000 TEU-Km

⁽¹⁾ Transit transport reported by Bulgaria has been excluded to provide comparability over time for the series presented

Source: Eurostat (online data code: www.go.qcnave)

Movements in EU freight container transport followed a similar quarterly pattern to total transport up to the fourth quarter 2010. But contrary to total transport performance the uptrend for the container transport performance (expressed as TEU-km) already started in the first quarter of 2011, and reached a higher level than recorded before the global economic crisis in the third quarter of 2011. However in the fourth quarter of 2011 another decline was recorded.

Compared with 2010, EU freight container transport performance in 2011 rose by 15.1% for

loaded and 22.3% for empty containers giving a 17.1% rise in total. Total container transport performance in 2011 reached a level which is more than 7% above the value in 2007 before the global economic crisis. The largest contribution came from the Netherlands, which replaced Germany, the leading country in total container transport performance in previous years. This was mainly due to a doubling of transport of loaded containers in the Netherlands and a reduction of about 20% in Germany.

Table 5: Container transport performance on inland waterways - 1 000 TEU-KM

'Metal ores' is the most important individual goods category transported

Figure 3: EU-27⁽¹⁾ transport performance by main type of goods in 2011 on inland waterways - % in TKm

(¹) EU-27 does not include data for Italy, Lithuania and the United Kingdom

Source: Eurostat (online data code: www.go.atygo)

At the EU level, the main types of goods (according to NST2007) transported are the categories 'other' and 'metal ores'. Together they account for more than half of all goods transport on EU inland waterways in 2011. Compared with 2010, the shares for these groups in total transport performance decreased by 2.3 and 1.6 percentage points respectively. This was also the case for 'agricultural products' (01) as well as for 'coal and crude petroleum products' (02) which decreased by 1.7 and 1.0 percentage

Figure 4: 2010-2011 growth rates of the main types of goods in the EU-27⁽¹⁾ on inland waterways - % in TKm

(¹) EU-27 does not include data for Italy, Lithuania and the United Kingdom

Source: Eurostat (online data code: www.go.atygo)

points respectively. Between 2010 and 2011 only 'coke and refined petroleum products' (07) with a growth of more than 19% and 'chemicals, chemical products, man-made fibers, rubber and plastic products, nuclear fuel' (08) with almost 46% recorded a rise in transport performance. As in 2010, the shares in total transport performance of 'coal and crude petroleum' (02), 'metal ores' (03), 'agricultural products' (01) and the category 'others' decreased in 2011.

Only self-propelled barges increased shares in total EU transport performance in 2011

Figure 5: EU-27 transport performance by type of vessel in 2010 and 2011 on inland waterways - Mio TKm

Source: Eurostat (online data code: www.go.atyve)

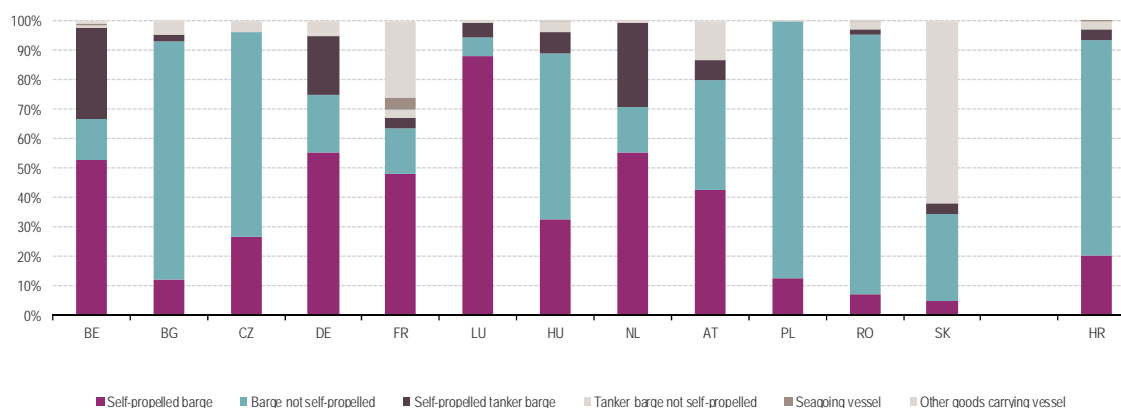

In 2011, either 'self-propelled barge' or 'barge not self-propelled' were the predominant types of vessel used for goods transport on EU inland waterways. The first vessel type was the only one

which increased its total transport performance between 2010 and 2011. Out of the 13 countries, for which data are available, one of these two vessel categories transported the largest volumes in

6 countries each. ‘Self-propelled barges’ reached shares of more than 50% in total transport in the Benelux states and Germany, while ‘barges not self-propelled’ were the dominant element in most eastern European countries, with especially high

shares in Poland and Romania (each more than 87%). The only exception was Slovakia where ‘other goods carrying vessels’ accounted for almost 56% of total goods transport.

METHODOLOGICAL NOTES

All figures presented in this publication have been extracted from the Eurostat online inland waterways transport database. The related datasets are collected according to the Regulation on statistics of goods transport by inland waterways of the European Parliament and the Council (EC) [No 1365/2006](#) implemented by the Commission Regulation [No 425/2007](#) and amended by the Commission Regulation [No 1304/2007](#).

Data coverage

13 Member States are obliged to deliver data: Belgium (BE), Bulgaria (BG), Czech Republic (CZ), Germany (DE), France (FR), Luxembourg (LU), Hungary (HU), the Netherlands (NL), Austria (AT), Poland (PL), Romania (RO), Slovakia (SK) and the United Kingdom (UK). Following the requirements of the Regulation No 1365/2006 (article 2 point 3), the United Kingdom is delivering only a reduced annual dataset E1 (annex E of the Regulation 1365/2006).

On a voluntary basis, Italy (IT), Lithuania (LT) and Finland (FI) provide the reduced dataset E1 (annex E of the Regulation 1365/2006).

The acceding country Croatia (HR) is providing data according to the Regulation requirements.

Calculation of EU aggregates

EU-27:

When presenting quarterly data (Figures 1, 2 and tables 1, 2), EU-27 includes only Member States obliged to provide data.

When presenting annual transport of goods (Tables 3, 4 and figures 3 and 4), EU-27 includes data for all Member States providing data (mandatory and voluntary).

When presenting annual container data (Figure 2 and table 5), EU-27 includes only Member States obliged to provide data.

When presenting annual data by type of vessel (Figures 5 and 6), EU-27 includes only Member States obliged to provide data

Calculation of EU-27 aggregates: In Table 4, the EU-27 international and total goods transport in **tonnes** is calculated excluding double counting. The EU-27 total international transport is calculated by adding the international loadings plus the international unloading for which the loading country is not in the EU-27. Then, the EU-27 total transport is calculated by adding the national transport and the total international transport.

Definitions

National inland waterways transport: inland waterways transport between two ports of a national territory irrespective of the nationality of vessel.

International inland waterways transport: inland waterways transport between two ports located in different national territories.

Inland waterways transit: inland waterways transport through a national territory between two ports both located in another national territory or national territories provided that in the total journey within the national territory there is no transshipment.

Container: transport equipment of a permanent nature, strong enough for suitable repeated use, specially designed to facilitate carriage of goods by one or more modes of transport, fitted with devices permitting its ready handling, to be easy to fill and empty of a length of 20 feet or more.

TKm (Tonne-kilometer): Unit of measurement of goods transport which represents the transport of one tonne of goods over a distance of one kilometre.

TEU (Twenty-foot Equivalent Unit): A statistical unit based on an ISO container of 20 foot length (6.10 m) to provide a standardized measure of containers of various capacities and for describing the capacity of container ships or terminals. One 20 foot ISO container equals 1 TEU.

TEU-Km (TEU-kilometer): Unit of measurement representing the movement of one TEU over one kilometre.

Symbols

“:” not available

“-” not applicable or real zero

“0” less than half of the unit used and thus rounded to zero

“p” provisional data

“e” estimated data

Country specific notes

Belgium: 2011 data are estimated and provisional.

Bulgaria: Quarterly transit transport is available from 2010. Annual transit transport is available from 2008 but in 2009 the country implemented a new methodology for the collection of this kind of traffic. To allow comparability, transit traffic has been used for the calculation of 2009-2010 quarterly growth rates.

The Netherlands: 2010 and 2011 data are estimated and provisional.

Romania: From 2010 (quarterly data), and 2009 (annual data) the country has implemented a new methodology for the collection of transit data.

Croatia: Quarterly transit transport is not available.

Breakdown by group of goods

The NST 2007 classification consists of the following 20 goods divisions:

- 01 Products of agriculture, hunting, and forestry; fish and other fishing products.
- 02 Coal and lignite; crude petroleum and natural gas.
- 03 Metal ores and other mining and quarrying products; peat; uranium and thorium.
- 04 Food products, beverages and tobacco.
- 05 Textiles and textile products; leather and leather products.
- 06 Wood and products of wood and cork (except furniture); articles of straw and plaiting materials; pulp, paper and paper products; printed matter and recorded media.
- 07 Coke and refined petroleum products.
- 08 Chemicals, chemical products, and man-made fibers; rubber and plastic products; nuclear fuel.
- 09 Other non-metallic mineral products.
- 10 Basic metals; fabricated metal products, except machinery and equipment.
- 11 Machinery and equipment n.e.c.; office machinery and computers; electrical machinery and apparatus n.e.c.; radio, television and communication equipment and apparatus; medical, precision and optical instruments; watches and clocks.
- 12 Transport equipment.
- 13 Furniture; other manufactured goods n.e.c.
- 14 Secondary raw materials; municipal wastes and other wastes.
- 15 Mail, parcels.
- 16 Equipment and material utilised in the transport of goods.
- 17 Goods moved in the course of household and office removals; baggage transported separately from passengers; motor vehicles being moved for repair; other non-market goods n.e.c.
- 18 Grouped goods: a mixture of types of goods, which are transported together.
- 19 Unidentifiable goods: goods, which for any reason cannot be identified and therefore cannot be assigned to groups 01–16.
- 20 Other goods n.e.c.

European Statistical Data Support:

With the members of the 'European statistical system', Eurostat has set up a network of support centres in nearly every Member State and in some EFTA countries.

Their role is to provide help and guidance to Internet users of European statistics.

Contact details for this support network can be found on the Eurostat website at:

Container transport at the level before the global economic crisis

Figure 2: Quarterly transport performance of containers on inland waterways in EU-27⁽¹⁾ - 1 000 TEU-Km

(¹) Transit transport reported by Bulgaria has been excluded to provide comparability over time for the series presented

Movements in EU freight container transport followed a similar quarterly pattern to total transport up to the fourth quarter 2010. But contrary to total transport performance the uptrend for the container transport performance (expressed as TEU-km) already started in the first quarter of 2011, and reached a higher level than recorded before the global economic crisis in the third quarter of 2011. However in the fourth quarter of 2011 another decline was recorded.

Compared with 2010, EU freight container transport performance in 2011 rose by 15.1% for

loaded and 22.3% for empty containers giving a 17.1% rise in total. Total container transport performance in 2011 reached a level which is more than 7% above the value in 2007 before the global economic crisis. The largest contribution came from the Netherlands, which replaced Germany, the leading country in total container transport performance in previous years. This was mainly due to a doubling of transport of loaded containers in the Netherlands and a reduction of about 20% in Germany.

Inland waterways freight transport - quarterly and annual data

After recovery in 2010 another renewed decline for inland waterways transport in 2011.

In brief

- **EU inland waterways transport performance in millions of tonne-kilometres (TKm) in 2011 is 4.9% lower than in 2010.**
- **Total EU inland waterways transport declined in the fourth quarter of 2011.**
- **In 2011, the weight of goods transported on EU inland waterways increased for national and international transport.**
- **Container transport decreased by almost 11% in the fourth quarter of 2011.**
- **'Metal ores and other mining and quarrying products; peat; uranium and thorium' (NST2007 – goods group 03) account for the highest share in total goods transport in 2011.**
- **Transport performance of 'Self-propelled barges' responsible for more than 50% of the total in the EU.**
- **'Self-propelled barges' are mainly used for goods transport in the Benelux countries and Germany.**
