Road safety in the regions of the European Union

Road safety has improved considerably, but there is still work to be done

Between 1989 and 1995, the number of deaths caused by road traffic accidents fell by almost 14% in the European Union. While the extent of the fall varied across the Member States, the biggest improvements were recorded in Finland (-40%), Sweden (-37%) and the United Kingdom (-32%).

Whatever the indicator used (the number of deaths relative to total population size or to the total number of private cars), there are still considerable differences between the regions of the Union.

Road safety in the European Union

The number of deaths caused by road accidents is an indicator that is used to assess in part the quality of the road network and hence to evaluate efforts made to improve all aspects of the network (the quality of roads, signs, etc.). Obviously, other factors also affect road safety, such as the cultural attitude to cars or to observing traffic regulations (on speed, safety belts, etc), the quality of cars, etc.

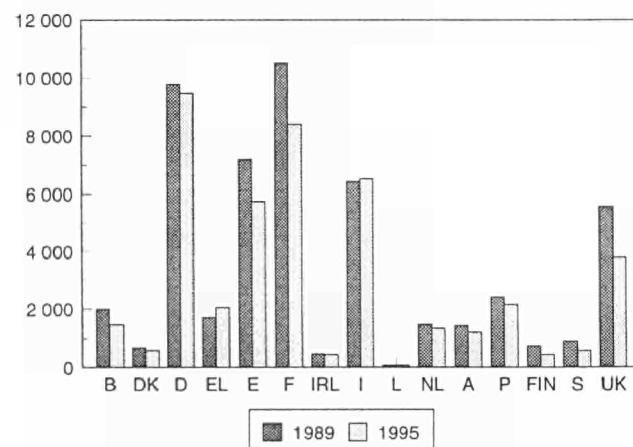

All accident victims are considered here, including pedestrians, cyclists, motorists, passengers, etc.

Despite the existence of an international standard, all Member States do not record road deaths in the same way (see note on p. 11).

The number of people killed on EU roads has fallen

In 1995, almost 44 200 people lost their lives on the roads of the European Union (Figure 1) which represents 1.4% of total number of deaths. Between 1989 and 1995, the number of deaths due to road accidents declined by nearly 14% on average.

There was an improvement in almost all Member States, with the biggest decline in road deaths occurring in Finland, Sweden and the United Kingdom (down by 40%, 37% and 32% respectively). The fall was considerably lower in Ireland (-5%) and Germany (-3%). Austria matched the Community average with a 14% decline in its death rate.

There was a very slight worsening of the situation in Italy and Luxembourg, with increases of 2 and 1% respectively. The situation in Greece is, however, more worrying with the number of deaths rising by 20%, (Figure 2).

The northern regions are becoming increasingly safe

There are even greater differences in the change in the number of deaths at regional level (Table 1).

Apart from a single region in Spain, the greatest decline in the number of road deaths occurred in the northern regions of the Union: in four Finnish, one German, one Dutch and two Swedish regions as well as the Brussels region.

The most marked falls in the death rate occurred in the regions of Hamburg in Germany (down 60%) and Castilla-La-Mancha in Spain (down 54%).

The Åland region of Finland was an exceptional case with only one death as a result of a road accident in 1995 (compared with 7 in 1989).

The regions with the biggest rise in the number of road deaths were in Greece and Germany. The death rate rose by between 37 % and 95 % in Germany's five new Länder. In Greece, the increase occurred mainly in the island regions, with Notio Aigaio holding the record (+119 %). Only two regions of Greece (Peloponnisos and Voreio Aigaio) saw an improvement in their situation.

It should be noted that all Member States apart from Finland, Sweden and the United Kingdom had at least one region where the situation deteriorated.

The safest roads are in the United Kingdom

When comparing regions in terms of the number of road accidents, the population size and number of cars must be taken into account.

In 1995, there were on average 119 deaths per million inhabitants on EU roads, compared with 148 per million in 1989 (see Table 2 and map). The United Kingdom had the lowest death rate (64), followed by Sweden (65), the Netherlands and Finland (with 86 apiece).

Portuguese and Greek roads were the most dangerous for users, with 217 and 195 deaths per million inhabitants respectively.

The urban regions of Hamburg, Greater London, Stockholm and Wien had the safest roads, with 27, 30, 31 and 34 deaths per million inhabitants respectively.

In 1995, the Luxembourg region (B) was the most deadly (416 deaths per million inhabitants), followed

by the Algarve (P- 411) and Alentejo (P- 338), Brandenburg (D- 302), Centro (P-291), Sterea Ellada (EL-286), Meklenburg-Vorpommern (D - 273) and Burgenland (A - 262).

Pais Vasco (E) had the Union average of 119 deaths per million, while the regions of Alsace (F), Norra Mellansverige (S), Friesland (NL) and Açores (P) were around the average.

Similar trends emerge if the number of deaths relative to the number of cars is examined. This indicator shows that it is safest to use the roads in urban regions or in the regions of the United Kingdom (Table 3 and map).

Only in the regions of Greece are the figures significantly higher than the Union average, with over 900 deaths per million private cars, as opposed to the Community average of 277.

Alsace (F) and Noord-Brabant (NL) came very close to the Community average with 278 and 285 deaths per million private cars respectively.

The very significant gaps between regions widened even further between 1989 and 1995. As regards the number of deaths relative to population size, the difference ranges from a value of 1 (Hamburg -D with 27 deaths per million inhabitants) to 15 (the province of Luxembourg -B with 416) in 1995 compared with

a range of 1 to 10 in 1989. The number of deaths per million private cars has an even greater range, from a value of 1 (Hamburg with 64 deaths per million cars) to 46 (Sterea Ellada - EL with 2 968), compared with a range of 1 to 27 in 1989.

METHODOLOGICAL NOTES AND SOURCES

Deaths caused by road accidents: these cover all categories of victim (pedestrians, cyclists, motorcyclists, car drivers, etc.).

There are big differences in terms of the period taken into account after an accident. All Member States apart from the following apply the international standard of 30 days established by the ECMT (the European Conference of Ministers of Transport, an OECD body) and the United Nations Economic Commission for Europe:

- EL: 3 day period;
- E: 24 hour period (up to 1993);
- F: 6 day period;
- I: 7 day period;
- A: 3 day period (up to 1991);
- P: persons killed outright or who die on the way to hospital.

Deaths after these periods are classified as injuries.

To obtain comparable data and hence to apply the standard 30 day period, the following coefficients must be used:

- EL: + 15 %;
- E: + 30 % up to 1993;
- F: + 9 % up to 1992, then 5,7%;
- I: + 8 %;
- A: + 12 % up to 1991;
- P: + 30%.

REGIO contains the non-adjusted data provided by the Member States. For example, by applying the relevant coefficients, the number of deaths in Portugal in 1995 would rise from 217 to 282 per million inhabitants and the number of deaths in Greece would increase from 195 to 224 per million.

NUTS: Nomenclature of Territorial Statistical Units. The nomenclature in current use subdivides the territory of the EU into 77 regions at NUTS Level 1, 206 regions at NUTS Level 2 and 1031 at NUTS Level 3, each NUTS level being a grouping of regions at the level below.

" ; " = data not available.

Publications:

- Regions: statistical yearbook;
- Transport: annual statistics.

Source: REGIO

REGIO: apart from the indicators presented here, the REGIO databank contains other series of regional indicators on transport (passenger and goods flows by mode of transport, infrastructure, etc.), plus other statistical domains (demography, agriculture, employment, unemployment, economic accounts, energy, research and development, etc.).
