

### *Cattle population survey for May - June 1994*

## End to fall in numbers and beginning of production recovery

Following a marked cyclical downturn, the Community's cattle herd has settled at around 81 million head of cattle. The rapid reduction in the number of dairy cows in favour of suckler herds seems to have come to an end. A favourable economic outlook on the meat market and very low stock levels suggest that the production increase witnessed in the second half of 1994 should continue into 1995

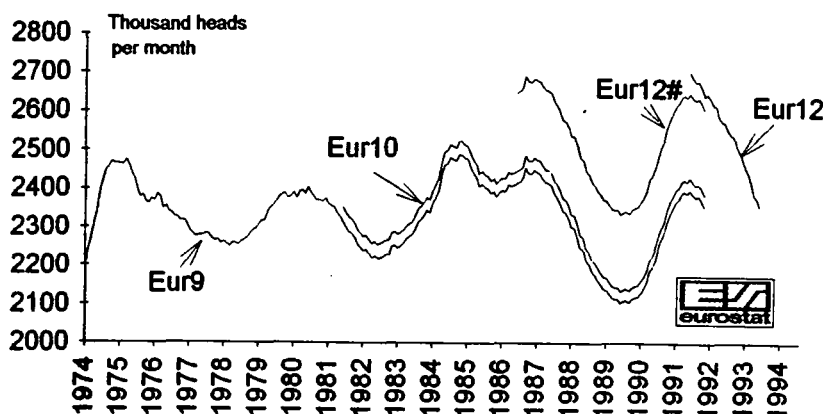

The cattle stock survey carried out in May/June in the various countries of the Community bore witness to

an overall stabilisation in stocks after a three-year long destocking phase, the result of which was a

reduction in the Community herd of more than 5% between 1990 and 1993.

At the end of the first half of 1994 there were 81.2 million head of cattle in the Community, the same number as in June 1993. The number of cows remained the same overall. Denmark, where stocks had not varied in recent years, was the only country to register a significant fall in its herd (-6%). In the Netherlands the downward

## Cattle population May-June 1994

trend continued but at a slower pace. This was also the case for Germany, where the large-scale stock reductions subsequent to reunification came to an end. In France and Portugal the numbers remained more or less constant. In Spain and the United Kingdom, however, an increase in the herd of more than 1% was reported. Italy, Belgium and even Ireland were all moving in a positive direction. In Ireland as in contrast to all the other Community countries the herds have been growing constantly since 1990.

### Milk cows decrease by 1%

Meanwhile there is a tendency towards a reduction in the dairy cow population in most of the countries. Admittedly, this reduction is limited (1% or less) and the population has remained above the 21

million line. It must not be forgotten that between 1991 and 1993, the Community's farmers abandoned nearly 10% of their dairy cow population in favour of suckler cows.

### One cow in three is a suckler

This trend was particularly marked between 1992 and 1993, the number of suckler cows growing by 800 000 heads with the announcement of the increase in the premium on suckler cows and the quota of cows eligible for premium. This craze died down in 1994, especially

since the premium now concerns only meat strain cows. In the EU today, one in three cows is a suckler. This partly explains the constant increase since 1986 in cow slaughtering weight.

Among animals reared for breeding, which determine the future development of herds - even though the livestock farmers' intentions are never fixed - there are fewer "heifers of two years or more" than in May-June 1993 (-3%), whereas numbers have remained constant for the category "heifers of one or two years" and have risen

### Carcass weight of slaughtered cows

slightly for the "under one year" category. These figures would seem to confirm the beginning of a stable period for cattle stocks, though they do not necessarily point to a reversal in trends for the time being.

As far as animals for slaughter are concerned, the four main calves producing countries - Spain, France,

beyond 24 months and tend to prefer a short production cycle. In the United Kingdom, however, judging by the increase in the number of males and females of over two years (+16%), this activity would appear to be back in favour.

### Bright spell

If the May - June 1994 survey and the slaughtering

1993. Though this development may appear to be negative, it represents a break with the previous trend, which saw a fall in production of 11% in the space of two years. Following a new reduction in slaughterings in the first half of 1994, production should pick up in the second half of the year and pass the level recorded for the second half of 1993.

*The stock reductions of cattle in Germany come to an end*

the Netherlands and Italy - all recorded a considerable increase in beef calves (+7% on average).

Adult bovine animals, on the other hand, are still decreasing in number (-1%). Although the sharp fall in numbers of livestock seems to have been checked for the most part, there are still contrasts from one country to another as regards trends in each category. French and Irish livestock farmers are still tending not to fatten

figures available are anything to go by, Gross Home Production in the Community should reach 28.3 million head of cattle in 1994, which is another drop of 1.5 % compared to the provisional figures for

This bright spell probably marks the end of a cyclical downturn in cattle production and the figures currently available suggest that production will recover in 1995. Although supply appears to be sluggish in many countries, this should not last. In truth, the cattle meat market appears to be in good health once more, as borne out by the absence of intervention buying for more than a year and the historically low level of intervention stocks.

Meat production by category in 1994
