CORRESPONDING PRODUCTION OF HEAT <sup>2)</sup>				
T O T A L	Tcal	5 049	5 273	5 180

1) PCI = net calorific value

2) Regarding the combined heat and power plants the portion of the fuel consumption that is attributed to the electricity production has been estimated considering the expected equivalent production of a merely electricity producing plant.

Accordingly the efficiency gain due to combined heat and power production is fully accounted for on the heat balance-sheet : for this reason the output heat data appear higher than the input heat data.
