# SYSTEM OF STRUCTURAL INDICATORS

Some indicators which normally should appear in the "SIS" proposed hereunder are absent. There are various reasons for this : lack of historical statistical series, data gaps for some Member State, heterogenous sources, poor quality of the disposable data, ...

The establishing of many indicators presented here met with similar difficulties. As the footnotes show, these difficulties were overcome on a pragmatic way. This implies the prudent use of the tables thus drawn-up and, in particular, the avoidance of too rigorous an interpretation of the comparisons between Member States

---

## STRUCTURAL INDICATORS SYSTEM

	<u>Page</u>
FOREWORD	5
I. <u>POPULATION AND EMPLOYMENT</u>	8
I.1 Population	11
a) Total population	
b) Net migration	
c) Population of working age	
d) Community population of working age: percentage	
I.2 Labour force	13
a) Total employment	
b) Wage and salary earners	
c) Female activity rate	
I.3 Employed population by sector	15
I.4 Hours of work in industry	16
a) Average annual number of hours worked	
b) Average weekly hours of work offered per manual worker (October)	
I.5 Unemployment	17
a) Average annual unemployment rates	
b) Percentage of unemployed of age groups 14-25 and 45-65 in total unemployed	
c) Graph	
I.6 Migrant workers	19
a) As a percentage of wage and salary earners	
b) Graph	
II. <u>GROWTH AND DEVELOPMENT</u>	21
II.1 GDP at market prices	23
II.2 Value added by sector	24
a) Average annual rates of increase	
b) Sector shares in value added	
II.3 Productivity by sector	26
a) Average annual rates of increase	
b) Index numbers, Community average = 100	

II.4 Gross fixed capital formation and its distribution	28
II.5 Gross fixed capital formation	29
a) Gross fixed capital formation as a percentage of total GDP	
b) Gross fixed capital formation per inhabitant and per person employed, (Index numbers, Community average = 100)	
c) Gross fixed capital formation in the form of plant and machinery as a percentage of total GDP	
II.6 Expenditure on Research and Development	31
a) Breakdown of Central government appropriations by main category of objectives	
b) Total expenditure on R&D by financing sector	
II.7 Per capita consumption of primary energy products	33
III. <u>INCOMES</u>	34
III.1 Distribution of national income	35
III.2 Compensation of employees	36
a) Average annual rates of increase of compensation of employees per employee, in money terms and real terms	
b) Index numbers, Community average = 100	
III.3 Compensation of employees by sector	37
a) Average annual rates of increase in compensation of employees by employee	
b) Ratio of compensation of employees per employee in other sectors to compensation of employees per employee in agriculture	
III.4 Compensation of employees and national income	38
IV. <u>PRICES AND COSTS</u>	39
IV.1 GDP price deflator	41
IV.2 Consumer price index	42
IV.3 Wage costs in industry	43
IV.4 Commodity price index	44
IV.5 Terms of trade	45

<b>V. FOREIGN TRADE</b>	<b>46</b>
V.1 Foreign trade as a proportion of GNP	48
V.2 Exported value added	49
a) Direct and indirect value added included in exports	
b) Share of exported value added by industry group in total value	
V.3 Degree of concentration of exports	51
V.4 Structure of foreign trade	52
a) Intra-Community trade	
b) Share of Community exports in total world trade, by CST product groups	
c) Changes in the structure of imports by CST product groups	
<b>VI. BUDGETARY MEANS</b>	<b>55</b>
VI. 1 General government expenditure	57
a) Share of public consumption and gross fixed capital formation	
b) Percentage breakdown of public expenditure	
VI. 2 General government revenue	59
a) Structure of general government revenue	
b) Per capita burden	
VI. 3 Tax burden	61
VI. 4 Financing of social welfare expenditure	62
<b>VII. REGIONAL DISPARITIES</b>	<b>63</b>
VII. 1 Labour force as % of total population	65
VII. 2 Employment by sector as % of total employment	67
VII. 3 Unemployment	69
VII. 4 Net migration per 1000 of population	70
VII. 5 GDP per person employed	72
VII. 6 Indicators of significant structural imbalance	74
a) Regions affected by one or several phenomena	
b) Percentage of the population living in the regions affected by the phenomena analysed	
<b>VIII. STANDARD OF LIVING</b>	<b>77</b>
VIII. 1 Private consumers' expenditure per inhabitant	78
a) Average annual rates of increase	
b) Index numbers, Community average = 100	
c) Consumers' expenditure broken down by category	

VIII. 2 Health	80
a) Expectation of life	
b) Infant mortality rate	
c) General government expenditure on health care	
d) Number of hospital beds per 10,000 inhabitants	
VIII. 3 Education	82
a) Number at school and university	
b) General government expenditure on education	
c) Pupil - teacher ratio	
VIII. 4 Social security	85
a) Social welfare benefits	
b) Level of social security	
VIII. 5 Housing	87
a) Ratio of rate of construction to the rate of growth of the population aged 15 and over	
b) Per capita investment in new housing

FOREWORD

1. There were two main reasons for establishing a system of structural indicators for the Community. In the first place, the quantity and variety of existing statistics were so great that they could hardly be used in their current form for any immediate assessment of structural differences significant in terms of Community objectives. Secondly, as the Community was gradually being developed, some of the differences emerged as having growing importance either as obstacles to integration or as bases for the common policies. In any case, it was felt that the structural differences must be kept under review. In practice, an investment had to be made in this field once it was decided to elaborate and implement the medium-term economic policy programmes, which advocated various structural measures which were felt to be necessary for the smooth operation of the Common Market and subsequent development of work on the construction of Europe. The decision to aim for economic and monetary union enhanced this need. In this context, it became clear that an instrument enabling the main economic variables to be compared was indispensable.

2. In September 1971, the Medium-term Economic Policy Committee entrusted a Group of experts with two tasks: first, that of assessing how a systematic analysis of regional disparities and of the problems posed by the need to achieve equilibrium on the labour market could be carried out; secondly, that of examining the problem involved in setting up a "monitoring system" or a set of indicators recording structural change.

The Group of experts reported on both these questions to the Committee early in 1972.

With regard to the first question, it was suggested that its two aspects should not be handled separately for the moment, but that the factors common to both should be given priority treatment, i.e. an important place in the analysis of regional disparities should be given to the study of the problems raised in the effort to achieve equilibrium on the labour market.

As for the development of a "monitoring system" recording structural change, the Group of experts specified the system's objectives and general features, defined the content of the indicators to be used in the first phase and outlined alternatives suitable for its subsequent development.

Having considered the Group's findings, the Committee requested that a system of structural indicators be worked out, and a tentative version of the system was published in July 1973.

In February 1974, the Committee reverted to the topic included in its previous terms of reference and asked the experts to revise and refine the system, to add indicators concerning the new Member States, and to suggest how the system could be regularly updated.

In the revision work, the Group endeavoured - wherever this was feasible - to develop indicators relating to regional disparities, with particular emphasis on population and employment problems.

3. In general, the revised and refined system of structural indicators, with statistics relating to the three new countries, is designed to meet two main requirements.

In the first place, the aim is to provide a basis - in the form of an assessment, consisting essentially of figures, of the scale of certain structural differences - for the qualitative analyses relating to the narrowing down of these differences, set out in the medium-term programmes and plans for the achievement of economic and monetary union. The identification and quantification of the key structural differences at each level of Community construction - the degree of importance being considered not per se but within the context of the Community's progress, having due regard to the objectives of the next stage - are intended to contribute to the Community decision-making process and, in particular, to future medium-term economic policy programmes.

Secondly, by giving the most concise presentation possible of the relative situations in the Member States from the point of view of the main socio-economic structures, a set of indicators designed to meet these requirements should constitute a supplementary working tool for the national and Community economic authorities, with a view to throwing more light on past and future objectives in the context of Community development.

---

1) "Structural Indicators System" (Doc. II/166/73-E)

4. Against this background, the Group started by identifying significant phenomena, particularly those directly concerned with Community economic policy programmes. It then endeavoured to construct a set of indicators, the basic data for which were to be chosen so as to enable changes in each of the indicators to be monitored. There were many intractable difficulties: data were lacking altogether for some of the most significant indicators, and as a result there was the danger that the projected "system" would simply turn out to be an annual digest of preselected statistics.

In addition, certain difficulties due to the lack of homogeneous and comparable statistical series formed obstacles to the enlargement of the "system" to the three new Community countries and to the inclusion of certain topics connected with the extension in scope and in depth of the field of exploration. Other statistical difficulties - particularly concerning the up-dating of data - arose from the change-over to the integrated system (ESA) of national accounts which the SOEC is developing.

Cooperation between the statistical and economic affairs departments in the individual countries, the SOEC, and the Commission's own departments (particularly the Directorate-General for Social Affairs and the Directorate-General for Regional Policy) has enabled the difficulties to be solved as far as is possible at the present time. However, any further extension in depth of the system could well require closer cooperation, in particular coordination and planning of essential basis work.

This is all the more important since the system of structural indicators, as now designed, must remain dynamic and progressive: dynamic in that this instrument of permanent and reciprocal information must go on showing the comparison of evolutionary processes and not of situations; progressive in that the field covered by the system and the degree of refinement of certain indicators should remain open to any changes which may prove necessary as time goes on.

The mere definition of the functions and objectives as outlined above is enough to show how the efforts which must be made if the "system" is to be constantly adapted to needs complement each other. It also shows that by its very nature such an instrument will always be imperfect and incomplete.

## CHAPTER I : Population and Employment

The population and employment trends in the Community generally reveal a divergence between the available labour force, whose growth slackened, and the number of jobs, which on the whole increased at an even slower pace. In some countries, such as Ireland and Italy, the number of jobs fell well short of the levels which could have been met by the potential labour force.

Generally speaking, apart from some special trends, the supply of labour, in terms of the number of hours worked, gradually declined throughout the Community for a number of reasons.

These include first of all a tendency, in general, for the rate of total population growth to slow down, despite heavy immigration. Demographic information at present available suggests that the trend will continue in the next few years, mainly because of the sharp downturn in the birth rate.

The slowdown in population growth is just as marked in respect of the population of working age, although this is the population group on which immigration has the greatest impact. The supply of labour has been "squeezed" by the rising school-leaving age and earlier retirement, the determinant factors in the contraction of available labour.

Lastly, apart from normal cyclical fluctuations, the average working week shows a distinct tendency to grow shorter in all Community countries.

However, other factors have worked in the opposite direction.

Firstly, net immigration constitutes a major factor in several Member States,

although the reasons for recruiting foreign workers are not always the same. Thus, in countries like Germany and Luxembourg the main problem seems to be that of meeting an overall shortage of manpower, whereas in other countries, such as France and Belgium, immigration acts more as a reserve to fill gaps in the national supply of labour in certain industries or trades. Another important factor sustaining the supply of labour was undoubtedly the increased participation of women in the production process, particularly in France, Belgium and the United Kingdom. This tendency is all the more remarkable since it developed despite a considerable rise in the percentage attending school, as evidenced by the general decline in the activity rate of women aged between 14 and 24. It should be noted, also that overall activity rates in the United Kingdom and Denmark are by far the highest in the Community.

Though providing a major boost to the numbers in or seeking gainful employment, the two main positive phenomena - immigration and female labour - did not, on balance, offset the factors curbing the rate of growth of the available labour force.

The trend of employment offered, i.e. the demand for labour, showed a long-term decline: the growth rate of demand tended to slow down and overall fell short of the supply of labour, also expanding at a slower rate. This pattern, which was very marked in Member States like Italy and the United Kingdom, was reflected in the trend of unemployment, which, from a relatively low level in most member countries between 1961 and 1963, tended to rise nearly everywhere. Unemployment, the brunt of which is still borne by school-leavers and other young people and by older workers, has a large structural aspect, to the various components of which it is not easy to assign any reliable weightings.

Several factors emerged during the period which affected the conditions governing the adjustment between the supply and demand for labour: the steady growth of the proportion of wage- and salary-earners in total employment; major changes in the distribution of the employed population between sectors - with a decline of employment in agriculture which has slowed down at roughly the same pace in all countries. These far-reaching structural shifts and rapid changes

in the productive system suggest that unemployment is first and foremost a matter of discrepancies between skills needed and those available. But this is certainly not the only explanation: the overall decrease in creation of employment leaves no doubt that in some cases the problem is due to insufficient capital formation.

1.1 POPULATION

A. Total population

DENMARK	42,4	53,5	40,9	51,1	58,0	53,2

a) Including Saar, excluding West Berlin.

b) Figure for 1968, there are no surveys in 1969 and 1970.

c) 1961 and 1971 : female labour force aged 15-59, 15-64 and 15-24

d) 14-54 years.

SOURCE : - Labour forces surveys 1960 and 1970 : SOEC - Social Statistics no 2bis/1963 and no 2/1971.

- SOEC - Social Statistics Yearbook 1970, 1971!

- UK, Ireland : national experts - Denmark : Population and Housing census 1960, 1970

NOTES :

Calculations for the six are based on Community surveys. However, as a result of changes in definitions from the 1968 survey onwards, the figures for 1960 and 1970 are not always comparable. Moreover, for 1960 mistakes have been found which have not been corrected. For the UK, Ireland and Denmark figures are calculated on the basis of the population censuses.

France	total	7,0	7,7	10,0	10,8	11,0
	of which EEC a)	2,4	1,7	1,7	1,7	1,7
Italy	total	0,0	0,2	0,3	0,3	0,3
	of which EEC a)	0,0	0,1	0,1	0,2	0,2
Netherlands	total	0,8	1,8	2,9	3,0	3,2
	of which EEC a)	0,4	0,7	1,3	1,4	1,3
Belgium	total	6,3	6,2	6,7	7,1	7,1
	of which EEC a)	4,7	4,1	4,1	4,0	4,1
Luxembourg	total	22,1	27,5	30,1	34,4	35,0
	of which EEC a)	19,9	23,4	23,6	23,7	24,0
United Kingdom	total	na	na	na	na	3,4(d)
	of which EEC a)	na	na	na	na	1,6(d)
Ireland b)	total	na	na	0,3	0,3	0,3
	of which EEC a)	na	na	(0,2)	(0,2)	0,2
Denmark c)	total	0,6	0,8	1,3 (e)	1,9	1,8
	of which EEC a)	0,3	(0,4)	(0,4)	(0,4)	(0,5)

a) 1960 to 1972 : EUR - 6. from 1973 : EUR - 9.

b) Excluding workers from the United Kingdom and the Commonwealth.

c) Excluding workers from the Nordic labour market.

d) Provisional (communicated by national experts) - Excluding Commonwealth workers holding U.K. passport. The 1971 census of population showed that 3 % of the labour force were born in the Commonwealth.

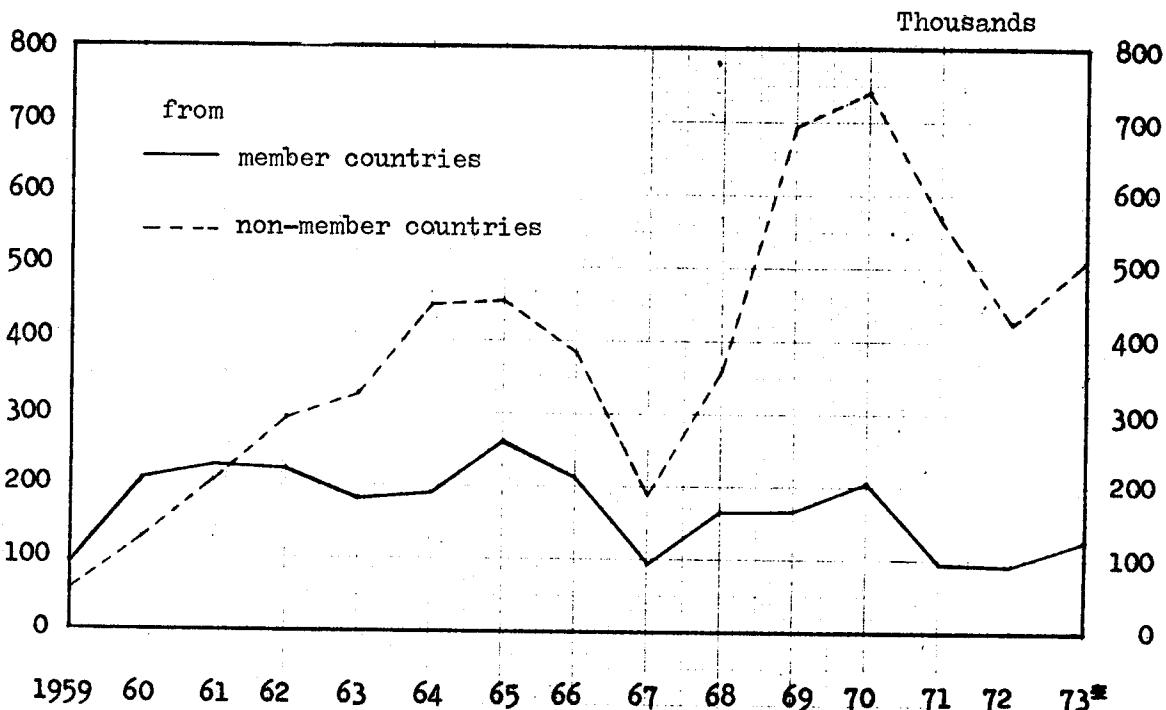

e) Including non-employee workers; on basis of population census.

Source : Figures supplied by national employment departments to the Coordination Office for the Freedom movement of Workers (EEC, Gen. Dir. for Social Affairs).

NOTE : Migrant worker : person wishing to take up paid employment in a country other than the country of which he has the nationality.

I.6 - MIGRANT WORKERS (continued)

B. Trend of new arrivals of permanent workers (1)

- Note : 1) Employment of foreign workers issued with their first work-permits.  
Work permits for Community workers were abolished from November 1968.
- 2) Belgium : Excluding intra-Benelux movements; as of November 1968 other  
Community workers not included.
- Germany : The figures for 1959-1960 include frontier workers. Following  
the abolition of the work permit for Community workers a new  
method of counting was instituted, from 1 January 1970, so  
that the data on these Community workers are not fully compa-  
rable with those for previous years.
- France : Excluding nationals of Algeria, Laos and of Black Africa  
formerly in association with France
- Italy : Including seasonal workers
- Luxembourg : Including frontier and seasonal workers and intra-Benelux  
movements
- Netherlands : The figures include frontier and seasonal workers for 1959-  
1963, seasonal workers from 1968 and intra-Benelux movements  
from 1969.
- 3) Nine Member States since 1 January 1973.
- \* Commission Departments' estimate

Source : Gen. Dir. for Social Affairs - working papers.

CHAPTER II : Growth and development

The breakdown of the Community's gross domestic product shows that major changes took place over the long term in the shares in the overall product accounted for by each country: from 1955 to 1972, Germany and France, in particular, considerably increased their shares, whilst that accounted for by the United Kingdom contracted to approximately the same extent. This "scissor" movement was largely due to very different performances in the investment field, but special trends with regard to employment (see Chapter 1) and productivity also played a role.

Except in two member countries -France and Italy- the rate of growth of productivity gathered momentum in all sectors during the 1960-1970 decade. Since then, the slowdown in productivity growth, which few industries or sectors have escaped, has been much less pronounced in industry than in the other sectors. But it must be noted that the calculation of productivity per person employed is subject to distortions affecting any conclusions to be drawn from it: for one thing, the calculation of productivity in the services and general government sector is largely conventional and in some countries there are no separate figures for the two areas, so that the trends shown by the tables are a good deal less reliable than would otherwise be the case; secondly, the trend recorded between 1970 and 1972 should be interpreted with caution because of the reference period is so short - this is particularly true of productivity in agriculture, where the weather can be a decisive factor; lastly, with a number of hours actually worked per year differing from one member country to another, account should, in many cases, be taken of this factor when conclusions are drawn from the calculation of productivity in terms of value added per person employed. Another point in connection with the analysis of the results of the calculations is the extent to which the calculation of productivity at 1963 prices and exchange rates may involve distortions in country-to-country comparability.

The productivity gains in agriculture were achieved through a slight increase in production and a very sharp decline in the number of persons working on the land, as noted in Chapter I. The fall in numbers working on the land is likely, in any case, to continue in the years ahead because of the age structure of the farming population and the lack of direct heirs on a large number of holdings worked by farmers now nearing retirement age.

As for gross fixed capital formation, the main feature is an increase in the investment ratio during the relevant period. The increase was particularly marked in industrial investment or investment in plant and machinery and in those countries where the investment ratio was lower at the outset: it is reflected in an increase in capital stock per person employed.

The increase in overall energy consumption per inhabitant between 1960 and 1972 was by no means uniform from country to country; one of the "growth leaders" in this area was Italy, with a jump of 140 %.

As for the pattern of energy consumption, the most noteworthy change during the period was the shift from coal to oil and natural gas as primary energy sources. While in 1960 natural gas accounted for only 2.7 % of the needs of the Six, by 1972 the figure was 12.3 % (11.7 % for the Nine). Over the same period, the share accounted for by coal dropped from 59 % to 21 % for the Six and to 24 % for the Nine. The share of oil (nearly all of it imported) increased from 30 % in 1960 to 62 % in 1972 for the Six, and to 59 % for the Nine.

II.1 - GROSS DOMESTIC PRODUCT AT MARKET PRICES

Breakdown by country (Community = 100)

	1955	1960	1965	1970	1972
Germany	24,0 <sup>a)</sup>	27,4	27,8	27,9	27,5

### CHAPTER III : Incomes

The distribution of national income between the various socio-occupational groups is influenced by many factors which must be taken into account before interpreting and comparing the figures.

The share of wages and salaries in national income increased during the period in question in all Community countries, primarily because of the fall in the proportion of total employment accounted for by the self-employed. But this change was also due to a change in the legal status of many sole proprietorships: on their incorporation, a large proportion of entrepreneurial income is reclassified as compensation of employees.

The proportion of national income accounted for by companies corresponds very largely to the direct taxes they pay and undistributed income: it is a function not only of the performance of companies but also of income distribution policy.

The trend of compensation of employees per employee at current rates of exchange in the various member countries shows two main features: firstly, the spread narrowed, particularly in the six original member countries of the Community and, secondly, the relative position of the United Kingdom deteriorated.

In interpreting Table III.4, which compares compensation of employees per employee and national income per person employed, it should be borne in mind that in some member countries many of the self-employed (small farmers working their own holdings, craftsmen) have lower incomes than wage- and salary-earners. During the period in question, the fall in the numbers in this group increased "statistically" the average income of the self-employed, and this masks to some extent the relative improvement in wage- and salary-earners' incomes. Consequently, the figures for France in particular probably overstate the relative deterioration in the position of wage- and salary-earners whereas in Italy there must have been some relative improvement.

Source : SOEC - National Accounts 1971, 1974, General Statistics N° 5/1975  
 Denmark 1960/1955 : Study Group on Medium-term Economic Assessments (Doc. 11/501/72).  
 Denmark, United Kingdom : national experts.

NOTE : A. Compensation of employees per employee is obtained by relating compensation of employees (gross wages and salaries + employers' social security contributions) to the number of wage and salary earners. The change in purchasing power (real compensation) is obtained by deflating the figures by the price index for private consumers' expenditure. (1970 = 100)

- The rates of increase have been calculated for each country at current prices and for the EEC at current prices and exchange rates.

B. The index numbers are calculated from compensation of employees per employee at current prices and exchange rates.

Ireland	75,6	76,9	77,6	74,3
Denmark	66,4	70,1	72,2	72,9
Community	71,4	71,6	72,2	74,0

Source : SOEC - ESA National Accounts N° 1/1974

NOTE : 1. The figures for the Community have been calculated at current prices and exchange rates.

2. The figures in this table have been calculated as follows :

Compensation of employees per employee

Net national disposable income  
Total employment

The net national disposable income differs from the national income (net national product at factor cost) in that it includes :

- net indirect taxes (taxes on production and imports less subsidies)
- the balance of unrequited current transfers (nec) with the rest of the world
- the balance of accident insurance transactions with the rest of the world

CHAPTER IV : Prices and costs

The real acceleration in the upward movement of prices began after 1970. Even before, some member countries had of course experienced bouts of strong inflationary pressure, but inflation was never as rapid or as persistent as in the present phase.

But not only has inflation in the Community gathered momentum: the differences in inflation rates between member countries are also much wider, and this partly explains the monetary upheavals of recent years.

Throughout the Community, consumer prices for manufactured products have increased less rapidly than average consumer prices, in contrast to the price of services. For agricultural and food products the rates of price increases seem to have been close to the average, while at the beginning of the period they were generally much lower than the average. This trend may be due to two factors : firstly, the value added element in agricultural products has considerably increased as a result of the expansion of distribution channels and the steadily higher degree of processing of foodstuffs placed on the market. Secondly, in a period of fast inflation, policy on agricultural prices has increasingly been used as an instrument to protect farmers' incomes, one result being that the trend of agricultural prices has been more closely aligned on that of other products.

On the cost side, the rates of increase in wage costs per unit of output has risen very sharply, with the inevitable impact on prices. Parity changes in recent years, on the other hand, have tended to narrow the gaps between wage-cost trends in the various member countries.

Until 1970, the trend of commodity prices exerted a stabilizing influence on Community prices and largely contributed to the steady improvement in the terms of trade. But since 1971 there has been an upward movement which has gradually accelerated, engendering a distinct improvement in the terms of trade of the commodity-exporting countries. This increase has had only a very modest impact on the heavy inflation from which the Community has been suffering.

The steady improvement in the terms of trade of the Community as a whole also owes something to parity changes, which since 1970 have probably offset the rise in commodity prices.

The sharpest improvement was in Germany, where the surplus on current account may be partly due to this favourable swing, given the low elasticity of German export prices.

Community	92,6	98,0	100,1	101,0	101,8

Note : Paasche-type indices obtained by dividing absolute values in national currency at current prices by the corresponding values calculated at 1963 prices.  
The Community indices have been calculated by dividing the values at current prices and 1963 rates of exchange by the corresponding values at 1963 prices and rates of exchange.

Source : SOEC-National Accounts 1972-1973.

CHAPTER V : Foreign Trade

A look at the individual countries' foreign trade positions expressed as a percentage of GNP reveals fairly sharp differences in the Community : Germany had a large trade surplus throughout the period covered, while Ireland and the United Kingdom were in continuous deficit. In the other countries, apart from isolated cyclical swings, foreign trade roughly balanced out. The picture changes if transfer payments and capital movements are included : the current accounts and particularly the basic balances were fairly close to equilibrium - if not actually in surplus - in all countries during the periods covered.

Exports from the Community countries go for the most part to a small number of countries. Exceptin the case of Ireland and Denmark, the share of the three and six leading customer countries in total exports of the Community countries increased between 1960 and 1972. For the six original member countries of the Community this was the logical effect of the dismantling of barriers to trade. In the case of the United Kingdom, the key to the trend towards increased concentration was the more rapid expansion of exports to Community countries than to many of the countries that constituted its traditional markets. The decrease in the share of the leading customer countries in Ireland's and Denmark's exports appears to have been largely a matter of slower growth in their exports to the United Kingdom.

Between 1960 and 1972 the Community's share of world exports rose significantly in respect of food products, beverages, and tobacco and remained fairly stable for most other products. The increase in the Community share in food trade was probably accounted for partly by high quality products and partly by surplus products the exporting of which was subsidized by the EAGGF. It is also quite clear that Community exports of machinery and transport equipment declined.

As regards the shares of the various categories of products in total Community imports, that of basic products other than energy fell distinctly while that of manufactured goods showed a corresponding increase. The relative weight

of imports of energy products tended to increase slightly in certain countries, whereas in others, notably France, there was a fairly marked decline. The situation in 1972 highlights Italy's heavy dependence in respect of imports of food products.

CHAPTER VI - Budgetary means

Overall, the share of general government spending (consumption + gross fixed capital formation) in GDP rose between 1956-60 and 1971-73 in all Community countries, except France, where it remained constant. In 1970-73, the figures varied considerably from one country to another, ranging from 15.9 % in France to 26.5 % in Denmark.

The structure of general government expenditure changed during the period in question. In Italy and Luxembourg, public consumption rose relative to investment, while in France, Belgium and Ireland it fell. In the other countries, there was little evidence of such a shift. At the end of the period, the structure was broadly the same everywhere in the Community, with consumption representing 78 % to 82 % of public expenditure in most countries. (In Italy, however, the figure was 84 % and in Luxembourg 69 %).

This situation highlights the difference in national traditions with regard to public involvement in the various fields analysed.

Public expenditure on education and cultural services is particularly high and steadily increasing in Belgium and the Netherlands. In the other countries the progress of public spending in this field is much slower. The proportion of welfare expenditure also increased during the period in question in all countries, with the advance being particularly marked in the Netherlands, France and Italy.

The proportion of expenditure devoted to national defence declined, however, in all countries. This is also the case for the trend of public spending on residential construction and on agriculture, except in France and Belgium.

The structure of general government revenue differs considerably from one country to another, reflecting the different traditions in the field of public finance. For example, the level of social security contributions is very low in the three new countries, where social security is traditionally financed from general taxation. In France and Italy it is current taxes on income and wealth which make a relatively small contribution to general government revenue.

The structure of general government revenue between 1960 and 1970 developed upon very much the same lines in all of the countries reviewed; there was an increase in the share of social security contributions (except in Luxembourg) and direct taxes on households and a decrease in the share of revenues accounted for by indirect taxes.

As for the equilibrium of public finance, the pattern of financing of expenditure tended to deteriorate: the number of Member States finding themselves unable to balance out current expenditures and revenues tended to increase, so that in Italy, for example, the imbalance had assumed disturbing proportions by the end of the period under review.

VI.1 - GENERAL GOVERNMENT EXPENDITURE

A Public consumption and gross fixed capital formation by general government as a percentage of GDP (at current prices)

		Germany	France	Italy	NL	Belgium	L	U.K.	IRL*	DK

CHAPTER VII : REGIONAL DISPARITIES.

The other chapters describe structural differences existing between Member States and the evolution of these differences over time. The purpose of this chapter is to highlight the structural characteristics of regions both within the States themselves and at Community level.

In general, statistical systems are less developed at regional than at a national level, particularly for less recent years. Moreover, regional statistics are not always homogenous from one country to another. In the present commentary on the tables of Chapter VII, these reservations will occasionally be stressed.

Activity rates differ noticeably from one country to another. It frequently differs to a greater degree between regions within a country. One should note however that between 1960 and 1970 the differences in activity rates both between countries and between regions within a country, with the exception of the Netherlands have been reduced. All regions of the Community, with the exception of Danish regions, suffered a decline in rate of activity during this period. The activity rate in the Netherlands appears very low compared to that of other countries : this is explained by the use in the Netherlands, as distinct from other countries, of a method of calculating in men/years; thus a worker working half-time during the course of a year is calculated as a half worker during this period.

The feature which merits the most attention is the large fall in the number of workers in agriculture in those regions where agriculture had been predominant.

Just as with activity rates, rates of unemployment differ significantly according to type of regions in all the countries of the Community. It has been decided to present an average of monthly data covering the four years from 1970 to 1973. In this way, it was attempted to prevent cyclical factors from exercising too strong an influence on the figures.

In the case of France, it should be noted that outside the regions of the South-East, where unemployment is of a sociological nature, a high rate of unemployment corresponds to an active labour market while structural underemployment is indicated by over employment in certain activities (agriculture, traditional tertiary) or by a low activity rate.

It should be noted above all that for certain regions an important indicator is the proportion of employment in declining industries, but it has not been possible to introduce this at present.

In the extreme regions, data relating to migratory movements agree, in direction and in size with the first two indicators which describe the development of employment.

The dispersion round the national average of products per person occupied in the regions is very different according to the country, and in general, it decreased between 1960 and 1970. It appears that this reduction might be correlated with the fall in the proportion of the population occupied in agriculture in the regions at the bottom of the scale.

Table VII.6 synthesises the principal indicators generally used to identify problem regions. Taken separately, none of these indicators has a specifically regional significance, but when several of them converge, difficulties of a regional nature can generally be identified.

The degree of regional disparity depends on the number of the regions as well as upon the definition of the geographical unit : for example, a division in which urban and rural areas are included in the same unit results in weaker disparities than when each unit is relatively homogenous.

Regions selected for this chapter have been, whenever possible, the basic geographical unit (B.G.U.) used by the Statistical Office of the European Communities in the publication of most of its regional statistics. Without pretending that they are completely comparable between countries, nor even at times within a country, the B.G.U. are sufficiently comparable to have been selected, given the present state of regional statistics.

Characteristics of regions used

Countries	B.G.U.	Number	Area		Population (1967)	
			Average km <sup>2</sup>	Coefficient of variation	Average (1000 inhab)	Coefficient of variation

a) national registered unemployment as a proportion of insured (Belgium, Ireland, Denmark); salaried labour force (Germany, France, Netherlands, U. Kingdom); civilian labour force (Italy). Average of monthly values over 4 years.

b) combined

c) non-agricultural unemployment

NOTE : Comparisons of unemployment rates may be helpful within countries, but international comparisons cannot be usefully made because the definitions of what constitutes unemployment differ from country to country, as also do the labour force basis by reference to which the percentage rates of unemployment are calculated.

DENMARK	-	-	10,7	-	-

a) or the nearest year for which data is available

#### CHAPTER VIII : Standard of living

The differences in private consumers' expenditure per inhabitant between the six original Community countries narrowed owing to a faster rise in the countries that were at the bottom of the scale - Italy, the Netherlands and Germany. The sharp deterioration in the relative position of the United Kingdom and the absence of any improvement in that of Ireland contrast sharply with the trends noted in the six original member countries.

The breakdown of private consumers' expenditure by category brings to light a gradual decline in all Community countries in the share of expenditure on food, beverages and tobacco. Conversely, there was an increase in the proportion of expenditure on medical care and health, transport and communications and, except in Italy, leisure, public entertainment, education and cultural services. The levels of some categories of expenditure differ sharply from one country to another, because of different consumer habits and the still very wide gaps between income levels.

The rise in the share of expenditure on education is a direct result of the raising of the school-leaving age and the increase in the number of young people who go on to university or other forms of advanced education. Expenditure on higher education was lower in Luxembourg probably because the country has no university of its own, so that students have to go to foreign universities.

The increase in the share of public expenditure on medical care and health was probably due not only to the higher income levels but also to better social security cover for this type of expenditure.

The amounts for social welfare benefits per capita (expressed in EUR) differ widely from one country to another. The discrepancies are seen to be less marked if the benefits are related to the corresponding living standards in each country. Nonetheless, Ireland, with about 13 % of GDP, and (though to a lesser extent) the United Kingdom, with 17 % of GDP, are still a good distance from the Community average, which is about 20 %.

VIII.1 PRIVATE CONSUMERS' EXPENDITURE PER INHABITANT

A. Average annual rates of increase at 1970 prices.

	1960/1955 a)	1965/1960	1970/1965	1973/1970
Germany	5,5 <sup>b)</sup>	3,7	3,7	3,1

1) SOEC-National Accounts. The former nomenclature has been used for 1960 and 1965.

2) ESA - European System of Integrated Economic Accounts. For 1970 and 1972 the new ESA nomenclature has been adopted.

3) These data are included in category 8 of the ESA (NA = TO).

4) For Denmark, final consumption of non-residents has not been broken down and is included in ESA column 8 (NA 10).

5) Community data for 1972 do not include figures for Luxembourg.

6) The Community figures have been calculated by converting figures in national currency into EUR at current rates of exchange.
