

# INDUSTRIAL SHORT-TERM TRENDS

Monthly

## INDEX OF INDUSTRIAL PRODUCTION

### Sharp fall in industrial production growth indices in the second quarter of 1980

On the basis of provisional returns from eight countries, the unadjusted index of industrial production for the European Community is estimated by EUROSTAT to have reached the level of 121.7 (1975 = 100) in June 1980, and to have fallen by 0.1% over the corresponding month of the previous year. This follows year on year increases of 3.9% in December 1979, 3.6% in February 1980, and 2.3% in April 1980 and suggests that the widely predicted downturn in industrial activity has gathered momentum in recent months. This view can be confirmed by analysis of year on year quarterly movements in the unadjusted index, which show that growth has decelerated from 5.2% (3rd quarter 1979) to 4.1% (4th quarter 1979) to 3.9% (1st quarter 1980) to approximately 1.0% (2nd quarter 1980). The very sharp fall in growth between the first and second quarters is particularly striking and is due predominantly to a widening in the number of Community countries experiencing unfavourable production trends. One country remaining outside this group, however, is Italy, where production growth still appeared to be soundly based during the second quarter.

Turning to short-term trends in the seasonally adjusted indices, the latest data show that the index of industrial production in the Community attained the level of 118.6 (1975 = 100) in June 1980, an increase of 0.7% over the figure recorded in May. More significantly, for the third consecutive month short-term growth has been at or below the zero mark (see table 2), providing further evidence of the downturn in industrial production referred to above. Looking at this phenomenon in terms of developments in the three major product regroupments it is clear, first of all, that the short-term growth performance in the Community's intermediate goods industries has weakened further over the last few months following low rates in the first quarter, whilst in the consumer goods sector rates have turned sharply downwards in the last two months. This follows the strong growth performance in this regroupment in the first quarter. By contrast growth rates in the investment goods sector have been very erratic since the beginning of the year with large swings being registered on a month to month basis. This is largely explained by the significant degree of variation in production trends in the four largest Community countries. In the last quarter, for example, rates for this regroupment remained stable and positive in Germany, increased substantially in Italy, and remained negative in France and the United Kingdom, whilst worsening significantly in the latter country.

In summary, it is clear that both short and long-term industrial production growth trends have been weakening to varying degrees in nearly all Community countries, a development which has important implications for the evolution of the EUR-9 index.
