Eurostat hat die Aufgabe, den Informationsbedarf der Kommission und aller am Aufbau des Binnenmarktes Beteiligten mit Hilfe des europäischen statistischen Systems zu decken.

Um der Öffentlichkeit die große Menge an verfügbaren Daten zugänglich zu machen und Benutzern die Orientierung zu erleichtern, werden zwei Arten von Publikationen angeboten: Statistische Dokumente und Veröffentlichungen.

Statistische Dokumente sind für den Fachmann konzipiert und enthalten das ausführliche Datenmaterial: Bezugsdaten, bei denen die Konzepte allgemein bekannt, standardisiert und wissenschaftlich fundiert sind. Diese Daten werden in einer sehr tiefen Gliederung dargeboten. Die Statistischen Dokumente wenden sich an Fachleute, die in der Lage sind, selbständig die benötigten Daten aus der Fülle des dargebotenen Materials auszuwählen. Diese Daten sind in gedruckter Form und/oder auf Diskette, Magnetband, CD-ROM verfügbar. Statistische Dokumente unterscheiden sich auch optisch von anderen Veröffentlichungen durch den mit einer stilisierten Graphik versehenen weißen Einband.

Veröffentlichungen wenden sich an eine ganz bestimmte Zielgruppe, wie zum Beispiel an den Bildungsbereich oder an Entscheidungsträger in Politik und Verwaltung. Sie enthalten ausgewählte und auf die Bedürfnisse einer Zielgruppe abgestellte und kommentierte Informationen. Eurostat übernimmt hier also eine Art Beraterrolle.

Für einen breiteren Benutzerkreis gibt Eurostat Jahrbücher und periodische Veröffentlichungen heraus. Diese enthalten statistische Ergebnisse für eine erste Analyse sowie Hinweise auf weiteres Datenmaterial für vertiefende Untersuchungen. Diese Veröffentlichungen werden in gedruckter Form und in Datenbanken angeboten, die in Menütechnik zugänglich sind.

Um Benutzern die Datensuche zu erleichtern, hat Eurostat Themenkreise, d. h. eine Untergliederung nach Sachgebieten, eingeführt. Daneben sind sowohl die Statistischen Dokumente als auch die Veröffentlichungen in bestimmte Reihen, wie zum Beispiel „Jahrbücher“, „Konjunktur“, „Methoden“, untergliedert, um den Zugriff auf die statistischen Informationen zu erleichtern.

Y. Franchet  
Generaldirektor

It is Eurostat's responsibility to use the European statistical system to meet the requirements of the Commission and all parties involved in the development of the single market.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of this information, Eurostat has set up two main categories of document: statistical documents and publications.

The statistical document is aimed at specialists and provides the most complete sets of data: reference data where the methodology is well-established, standardized, uniform and scientific. These data are presented in great detail. The statistical document is intended for experts who are capable of using their own means to seek out what they require. The information is provided on paper and/or on diskette, magnetic tape, CD-ROM. The white cover sheet bears a stylized motif which distinguishes the statistical document from other publications.

The publications proper tend to be compiled for a well-defined and targeted public, such as educational circles or political and administrative decision-makers. The information in these documents is selected, sorted and annotated to suit the target public. In this instance, therefore, Eurostat works in an advisory capacity.

Where the readership is wider and less well-defined, Eurostat provides the information required for an initial analysis, such as yearbooks and periodicals which contain data permitting more in-depth studies. These publications are available on paper or in videotext databases.

To help the user focus his research, Eurostat has created 'themes', i.e. subject classifications. The statistical documents and publications are listed by series: e.g. yearbooks, short-term trends or methodology in order to facilitate access to the statistical data.

Y. Franchet  
Director-General

Pour établir, évaluer ou apprécier les différentes politiques communautaires, la Commission européenne a besoin d'informations.

Eurostat a pour mission, à travers le système statistique européen, de répondre aux besoins de la Commission et de l'ensemble des personnes impliquées dans le développement du marché unique.

Pour mettre à la disposition de tous l'importante quantité de données accessibles et faire en sorte que chacun puisse s'orienter correctement dans cet ensemble, deux grandes catégories de documents ont été créées: les documents statistiques et les publications.

Le document statistique s'adresse aux spécialistes. Il fournit les données les plus complètes: données de référence où la méthodologie est bien connue, standardisée, normalisée et scientifique. Ces données sont présentées à un niveau très détaillé. Le document statistique est destiné aux experts capables de rechercher, par leurs propres moyens, les données requises. Les informations sont alors disponibles sur papier et/ou sur disquette, bande magnétique, CD-ROM. La couverture blanche ornée d'un graphisme stylisé démarque le document statistique des autres publications.

Les publications proprement dites peuvent, elles, être réalisées pour un public bien déterminé, ciblé, par exemple l'enseignement ou les décideurs politiques ou administratifs. Des informations sélectionnées, triées et commentées en fonction de ce public lui sont apportées. Eurostat joue, dès lors, le rôle de conseiller.

Dans le cas d'un public plus large, moins défini, Eurostat procure des éléments nécessaires à une première analyse, les annuaires et les périodiques, dans lesquels figurent les renseignements adéquats pour approfondir l'étude. Ces publications sont présentées sur papier ou dans des banques de données de type videotex.

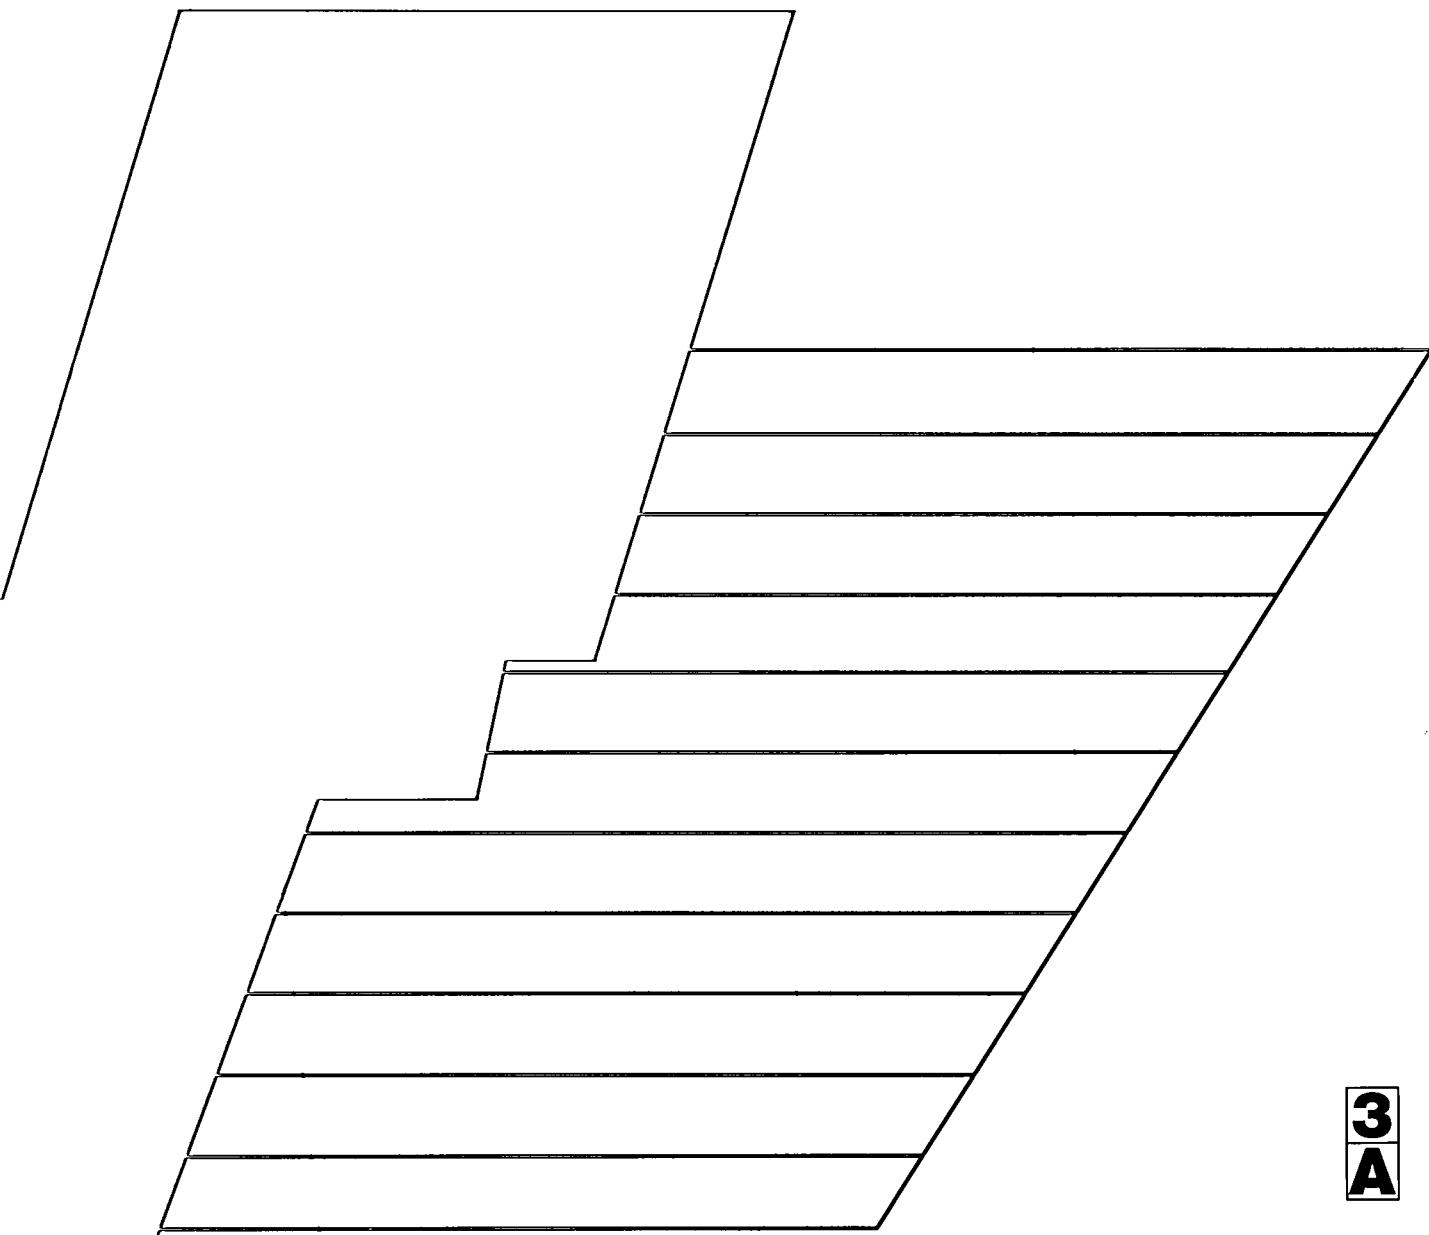

Pour aider l'utilisateur à s'orienter dans ses recherches, Eurostat a créé les thèmes, c'est-à-dire une classification par sujet. Les documents statistiques et les publications sont répertoriés par série — par exemple, annuaire, conjoncture, méthodologie — afin de faciliter l'accès aux informations statistiques.

Y. Franchet  
Directeur général

## REPORTS ON THE DEMOGRAPHIC SITUATION BY COUNTRY .....

# INTRODUCTION

Eurostat's **Demographic Statistics 1996** sets out data relating not just to the European Union and its 15 Member States, but also to the other member countries of the European Economic Area and Switzerland.

To avoid this publication becoming too bulky, events, rates, and probabilities for each year of age are not presented as tables, but in graph form. Data by single years of age nevertheless remain available in a database, access to which is explained in the following pages.

Demographic data are now available on diskette. This new medium will save yearbook users considerable time and will minimise the risk of errors from multiple data acquisition.

The contents and format of the diskette and how to obtain it are described in the following pages.

A new chapter on population movements due to "migration" (immigration and emigration) has been introduced.

The tables have been compiled directly from the data provided by the National Statistical Institutes of the 19 European countries, and from international publications (United Nations, Council of Europe) for non-member countries.

The data have been compiled using **SYSCODEM**, a series of programs designed to ensure comparability between countries. The system permits the use of a common method for computation of the various demographic indicators.

Eurostat's thanks go to the National Statistical Institutes, whose cooperation has been an essential factor in the completion of this publication.

Luxembourg, April 1996

# THE DEMOGRAPHIC SITUATION OF THE EUROPEAN UNION

## The EU and the world

Since 1950, the population of the EU has increased by 25%, and the world population by 120%. Thus, whilst the Union accounted for 12% of the world population in 1950, the figure had fallen to under 7% by 1 January 1995. Nevertheless, it still comes third in the table of major country groupings, after China (1 200 million) and India (900 million). It is followed by the CIS (290 million inhabitants) and the United States (255 million).

The United Nations' mean population projection still ranks the Union third in 2025, behind the same two countries.

Between 1990 and 1995, the population of the Union increased by a total of 0.3% per year, two thirds of this being attributable to inward migration. For the world as a whole, the natural population increase is 1.7% per year, and the migratory balance obviously nil. Population flows - both immigration and emigration - between the Union and the rest of the world in 1994 principally concerned Europeans (between 40% and 50% of migrants).

The total fertility rate for the Union - 1.45 children per woman in 1994 - is one of the lowest in the world. It is less than half the index for the world as a whole. Among the major country groupings, the average number of children per woman in Japan is also particularly low at 1.5 children. The highest figure is for Africa at 5.7 children per woman.

Infant mortality is still high in the developing countries, 77 out of every 1 000 babies dying before the age of one. In the European Union, the figure is six per thousand. The Member States of the Union have been most successful in reducing infant mortality, these levels rarely being achieved in the rest of the world.

Life expectancy at birth for the Union is one of the highest in the world (74.0 years for men and 79.6 for women, in 1994), though Japan is still in first position in 1994, with 76.6 years for men and 83.0 for women. In Africa, life expectancy at birth (both sexes) is around 55 years.

The European Union, together with Asia, is one of the most densely populated areas of the planet, with 116 inhabitants per km<sup>2</sup>, compared with 40 for the rest of the world.

On average, the population of the Union is older than that of the rest of the world: the proportion of under-15s is low (18% for the Union and 32% for the world) and of over-65s high (15% and 6% respectively). The fall in fertility and longer life expectancy are changing the age structure of the Union's population, which is becoming older. The decrease in mortality in many developing countries appears to have been accompanied over the past few years by a fall in fertility, so the populations of these countries can likewise be expected to age.

## The EU and Europe

Europe's population continued to rise in 1994, though growth rates were only just positive. In many countries, the growth was due principally to a positive migratory balance.

The Russian Federation is the most populous country in Europe (with 148 million inhabitants), followed by Germany and Turkey (81 and 61 million respectively).

Europe has a population density of 110 inhabitants per km<sup>2</sup>. The most densely populated country is Malta, with 1 160 inhabitants per km<sup>2</sup>, followed by two EU countries - the Netherlands, with 370 inhabitants per km<sup>2</sup> and Belgium, with 330.

In 1994, total fertility rate was below the population replacement threshold in almost all European countries, the only exceptions appearing to be Turkey, Iceland and Cyprus. Since 1985, this indicator has fallen dramatically in some central and east European countries. For example, in Romania, the average number of children per woman fell from 2.3 in 1985 to 1.4 in 1994.

The proportion of marriages relative to the population continues to fall, whereas the proportion of divorces continues to rise. On average, one marriage in three will end in divorce in the countries of the EU. In the rest of Europe, divorce rates are lower, but are also on the increase. The average age of women at first marriage is over 24 years in Western Europe, but is under 22.5 years in all east European countries.

Life expectancy at birth for men is over 70 in all 15 countries of the Union. In Europe, the shortest life expectancy is for the Russian Federation, where it is 62 years. On average, women live shortest in Turkey (70 years). In the Union, life expectancy for women is almost 80 years.

Infant mortality has remained unchanged in Eastern Europe since 1980, at around 15 per thousand, which is 2.5 times greater than in the Union. In spite of the absence of reliable data (underestimates), abortion would still seem to be used as a birth control method. Around 1990, 35 abortions were recorded for every 100 live births in the Union, compared with between 60 and 150 in central and eastern Europe.

The opening up of the borders of the countries of central and eastern Europe and the political changes that have occurred in this region have not led to massive population movements towards the EU countries. Although immigration has been far from negligible, particularly in Germany, flows are well down on 1992. Recent international migratory flows concerning the countries of central and eastern Europe reflect a trend towards a reversal in the migratory balance of certain countries such as Russia, Ukraine, Bulgaria and Slovakia.

The emigration surplus is restricted almost exclusively to eastern Europe (Estonia, Latvia, Lithuania, Poland, Romania), where political readjustments have prompted major outflows of population, mainly towards other European countries.

Italy, Greece and Spain, which once recorded net emigration, have seen the trend reversed. Iceland and Ireland continue to record net emigration.

## **The EU through time: short and medium-term trends**

### **Population growth slows down**

The overall growth rate of the European Union has been positive since 1960. It is currently around three per thousand. After a sharp increase in 1992 (+5.2%), the population trend slowed the following year, and during 1994 the resident population of the union increased by 1.14 million (+3.1%). The two components of this growth (natural increase and migratory balance) were positive. Two-thirds of this increase was from migratory flows.

The overall population increase was positive in all 15 countries of the Union. The natural increase was negative in Germany and just negative in Italy. Everywhere else it was positive. Ireland was the only country to record a negative migratory balance.

### **Fertility: decrease confirmed**

Between 1960 and 1975, the average age of women at the birth of their first child fell, but has since increased steadily in all countries of the Union. The resultant birth lag has been compounded by cohorts

of less fertile women. Total fertility rates - which are sensitive to changes in timing, in this case later conception - continue to fall. Given the continued fall in the total fertility rate, it can no longer be assumed that the birth lag brought about by later conception will be made good. Women may well have the number of children they want, but the increased age at the birth of the first child will have repercussions on the population of future generations. Women currently have fewer children during the course of their lives than their elders. This is borne out by fertility rates by generation: the generations of women born in 1940 had more than 2.2 children during their lives, whereas those born in 1960 will have just under 1.8.

In 1994, the total fertility rate for the Union was around 1.45 children per woman, compared with 1.96 in 1975. Rates are currently lowest in Spain, Italy and Germany at around 1.25, and highest in Sweden, Finland, Ireland and Denmark (at between 1.8 and 1.9). In the Scandinavian countries, the apparent stabilization of the total fertility rate is matched by a similarly stable average number of children by generation of mothers. It is possible that these three countries of the Union have reached cruising speed in respect of natural population increase. In 1960, Ireland and Portugal had the highest total fertility rates in the Union (over three children per woman). Since the seventies, the average number of children per woman in these two countries has continued to fall, and has now reached the fertility levels observed in the other countries of the Union.

### **Births outside marriage: the upward trend continues**

The proportion of births outside marriage (relative to births as a whole) changed very slowly between 1960 and 1980, increasing from 5% to 10% for the Union as a whole. During the following decade, the figure rose to 20%. Sweden has the highest number of births outside marriage - in 1994, the figure was 52%. In Greece, the proportion of births outside marriage has remained very low, and was under 3% in 1994.

In countries with a relatively small proportion of births outside marriage, marriage rates and the average age at marriage (particularly first marriage) have still a direct impact on fertility.

### **Marriages: the decrease continues**

The proportion of marriages entered into each year relative to the total population was around eight per thousand in the 1960s for the EU and thereafter fell steadily, except between 1985 and 1990. The decrease in the crude marriage rate for the EU is continuing. In 1994 it was 5.2%, compared with 5.3% the previous year. The greatest falls have been

recorded in Greece and the Netherlands, whereas countries with low marriage rates (Sweden, France, Ireland) have stabilized. The figure has started to rise in Denmark (+11%) and, to a lesser extent, Ireland (+5%).

Between 1960 and 1975/1980, the age at first marriage (men and women) fell in all countries of the Union. It then began to rise. For all countries and years, single women marry younger than single men. In 1994, single people married earliest in Portugal (24.6 years of age for women and 26.6 for men) and latest in Denmark (28.9 and 31.1 respectively). During their lives, proportionally fewer women remain single than men. However, once separated from their spouse (by divorce or widowerhood), men are more likely to remarry than women. In the generations born in 1940 (both sexes), around 10% of individuals remained single. For individuals born in 1954, the figure had risen to almost 20%. Sweden has the highest proportion of persons that will remain single all their lives: for the 1954 generation, 35% of men will remain single and 26% of women.

### **Divorces: on the rise again**

The number of divorces recorded in the European Union (relative to the total population) continued to rise between 1965 and 1990, when it fell somewhat. Since 1993, a period of new increases has begun. In 1994, the crude divorce rate was particularly high in the United Kingdom - around 3.1% - whereas the average for the Union was 1.7 per thousand inhabitants. Italy has the fewest divorces relative to the total population at 0.5%.

### **Mortality: the decrease continues**

Mortality rates have decreased drastically since 1960, and therefore life expectancy at birth for both men and women has increased considerably. Although the life expectancy of women, in all countries of the Union, is higher than that of men, the range in life expectancy between countries and sexes is not significant - 4 years for women and 4.5 years for men. Life expectancy at birth is currently highest for women in France (81.9 years) and lowest in Denmark (78.1 years). Life expectancy for men is highest in Sweden (76.1 years) and lowest in Portugal (71.6 years). Mortality rates by age are continuing to fall, other than for the 18-30 age-group, particularly for men.

The level of infant mortality for the Union as a whole continues to fall. From 35‰ in 1960, it fell to 7.6‰ in 1990 and 6.1‰ in 1994. This fall in infant mortality is mainly due to a fall in the number of deaths amongst infants aged under one month.

### **Non-national population: increase halted**

Of the 370 million individuals resident in one of the EU Member States on 1 January 1994, 95% had the nationality of the country in which they were resident, 1.5% had the nationality of another Union country and 3.5% were citizens of non-Member States.

The post-1985 increase in the non-national population is principally due to nationals from countries outside the European Union. Their number increased from 9 to 12 million between 1 January 1985 and 1 January 1994, whereas the number of non-national citizens of another Union country remained at around 5.5 million.

Since 1992, the trend in citizens of non-EU countries has stabilized, thus halting the increase in the population of non-nationals.

### **Naturalizations: the increase continues**

Between 1981 and 1994, the number of naturalizations in the 15 Member States of the European Union almost doubled, reaching some 330 000 persons in 1994. This upward trend has not always been evenly distributed - the increase since the early 90s has largely been due to a more than twofold increase in three countries - Germany, Sweden and the Netherlands.

In 1994, France recorded the greatest number of naturalizations (77 500). 1.7% of non-national residents acquired one of the nationalities of the Union. The ratio of naturalizations to non-national population was highest in the Netherlands at 6.3% of the resident non-national population.

### **International migration: further decrease of immigration**

Migratory flows relative to the resident population are greatest in Luxembourg, Germany and Ireland. However, differing national definitions lead to discrepancies in the statistics supplied by individual countries, discrepancies that are not easy to measure (cf. Explanatory notes). Immigrants are not necessarily "foreigners" - they also include nationals returning to their country after a period of residence abroad. Emigrants likewise include nationals leaving their country for another, and non-nationals leaving their country of residence for another.

Immigration fell in 1993 and 1994 in almost all countries of the Union except Sweden, the United Kingdom and Spain. The decrease in immigrants was particularly evident in Germany and France (for

France, immigration figures refer to non-nationals only). In 1992, in all Member States of the Union (except Sweden), 60-90% of arriving people were European (47% in Sweden). In 1994, the situation was quite different, when a third of immigrants were of European nationality. In Sweden, by contrast, two-thirds were European owing to arrivals of ex-Yugoslavian nationals (50% of total immigration).

#### **Asylum seekers: the decrease continues**

Over 3.4 million requests for asylum were received by the 15 Member States of the Union between 1985

and 1994. The number of requests for asylum made to the Member States of the EU was relatively stable between 1985 and 1987. It then rose spectacularly as from 1988, reaching a record high in 1992 (when the Member States received almost 80 000 requests in the month of July alone). This number has since fallen sharply: in 1994, numbers were at half the record 1992 level, and the total monthly average is no higher than around 25 000. However, in the Netherlands and the United Kingdom, the number of asylum seekers continued to grow in 1994. In certain countries, the number of asylum seekers was low, particularly in the countries of southern Europe.

<sup>1</sup> Including corrections due to population censuses, register counts, etc. which cannot be classified as births, deaths or migrations.

<sup>2</sup> 1993

# EXPLANATORY NOTES

## GENERAL

The statistics on births, marriages and deaths published in this yearbook are those supplied by the national systems for the registration of such events. The registration system is run under the authority of the Ministry of the Interior or the Ministry of Justice, or both, except in Ireland and the United Kingdom where they come under the Office of the Registrar-General, a self-contained department.

In certain cases the statistics on marriages and divorces have been taken from other sources. In a number of Member States data on marriages may be drawn from records of church weddings. Divorce statistics are drawn from court records. Divorce was not allowed in Ireland before 1995. In most countries the data are centralised by the Ministry of the Interior and forwarded to the national statistical institute.

Statistics on population, births, marriages and deaths cover both nationals and non-nationals habitually resident in the country concerned. Demographic events not taking place on the territory are not brought into national statistics. The statistics of births, marriages and deaths contained in this yearbook relate to the events which took place during the year, not to the events registered during the year.

Nine of the Union's 15 Member States maintain municipal registers of population (Table 1). The principle of such registers is an exhaustive and continuously-updated record of the population. In most cases the administration of the local territorial unit is responsible for maintaining the population register : births, deaths, changes of residence, etc.

One cause of variation in the data used is the lack of uniform definitions for the events registered, or uniform registration of events, or uniform statistical exploitation of civil population records.

Two definitions of "age" may be used for the classification of events occurring in a given year by age of the person concerned:

- the age reached during the calendar year under review, i.e. the year of observation minus the year of birth;
- the age in full years at the time of the event, i.e. the age last birthday.

Injudicious comparison of rates established using different definitions may give a skewed image of

international reality. The choice of one or other definition leads to significant differences, particularly in analysis by age, since the exact age in rates expressed in terms of "age last birthday" is likely to be around half a year more than that for rates compiled by reference to "age reached".

To cope with this problem Eurostat has established Syscodem, a permanent conversion method first used in 1991, which for statistics on fertility and first marriages, permits comparability of data compiled according to any definition from across the European Union. This system was made available to Eurostat by INED, the French National Institute of Demographic Studies.

Throughout the yearbook, data for Germany refer to the Federal Republic within its frontiers after 3 October 1990. Data for France are for metropolitan France, including Corsica. The totals for the Union refer to all 15 Member States.

The data for the European Economic Area do not include those for Liechtenstein when these are not available. In few cases figures are estimated by Eurostat when the countries cannot provide data for a single year.

## CHAPTERS A AND B: POPULATION CHANGE AND STRUCTURE

Annual estimates of population are based either on the most recent census round of 1990/1991 applying the component method, or on the data extracted from a of population register.

Total population figures are obtained from two types of estimates; updating is at various reference dates (Table 2).

- Ireland traditionally estimates its population in mid-April, and the United Kingdom at 30 June. These estimates then serve as a mean population. Iceland estimates its population at 1 December.

The remaining countries' principal estimates are made either at 1 January or at 31 December. The estimation method varies according to the observation method.

- Belgium, Denmark, the Netherlands, Finland, Sweden, Iceland and Norway rely on the state of the population register at a given date.

**Table 1: Comparison of types of population registers by Member State**

Computerised and centralised	Municipal register <sup>1</sup>	Register of foreigners	No register
Belgium (Registre National)	Belgium	German Fed. Rep. <sup>2</sup> (Ausländerzentralregister)	Greece <sup>3</sup>
Denmark (Central population register)	Denmark	Luxembourg <sup>4</sup>	France
Luxembourg (Répertoire général des personnes physiques)	German Fed. Rep. (Melderegister)	Liechtenstein (Zentralpersonenverwaltung)	Ireland
Finland (Central population register)	Spain (Padrón)	Switzerland (Zentrales Ausländerregister)	Portugal
Sweden (Total population register)	Italy (Anagrafe)		United Kingdom
Iceland (National register of persons)	Luxembourg		
Liechtenstein (Zentralpersonenverwaltung)	Netherlands (Gemeentelijke Basisadministratie Persoonsgegevens)		
Norway <sup>5</sup> (Central population register)	Austria (Melderegister)		
	Sweden		
	Liechtenstein		
	Switzerland (Melderegister)		

1 Partially computerised in Germany, Luxembourg, Spain, Italy, Austria and Switzerland; fully computerised in the Netherlands

2 Computerised and centralised register

3 Records are kept at municipal level for Greek nationals only

4 Register of foreigners based on the "Répertoire général des personnes physiques", but is not a part of it

5 Since 1994 the municipal registers have been linked to the Central Population Register

- Germany, Luxembourg and Italy use the register to obtain a figure of net migration which, added to the natural balance, gives the total population increase. Switzerland calculates its national population by the same process, but its non-national population is obtained from the register of foreign nationals.
- Greece, Portugal and France compile net migration from various sources, while the United Kingdom estimates it from a specific survey at the frontier (the International Passenger Survey).
- Ireland makes a global estimate of its population using a number of indicators and calculates net migration (Labour Force Survey) applying natural movement of population theory.
- Spain extrapolates an annual population figure from the results of the *Padrón* – a five-yearly census of the population and its principal demographic features. Hypotheses of mortality are taken from a table of mortality centred on the year of the *Padrón* and assumed to be constant for the period under review. Estimates are revised every five years with the following *Padrón*.

Total average mean population is in general the arithmetical mean of the population at 1 January of two consecutive years (Table 2), except in:

- Germany, where the arithmetical mean is that of each of the twelve months;
- Austria, where the arithmetical mean is that of five quarterly estimates;
- Denmark and the Netherlands, who take the population register total at 30 June or 1 July.

As indicated in Table 2, a number of countries make *post facto* amendments to their estimates in the light of the following census. The following countries have already published corrected data for the inter-census years: Greece, Spain, France, Ireland, Italy, Austria, Portugal, United Kingdom and Switzerland. Data relating to Spain are none the less provisional.

In Luxembourg, no *post facto* amendments were made to the population figures following the latest census, because there was very little difference between the results of the 1991 general census and STATEC's estimates. Furthermore, for the main demographic variables by age and citizenship, the census results are not more reliable than STATEC's estimates.

Countries use different sources to identify their population by nationality:

- Belgium, Denmark, Germany, Italy, Luxembourg, Netherlands, Finland, Sweden, Iceland,

Liechtenstein, Norway and Switzerland use the population register;

- France and Austria supply latest census results;
- Ireland and the United Kingdom draw their estimates from the Labour Force Survey;
- Spain, Greece and Portugal use a count of residence permits.

This yearbook offers new tables concerning the population by marital status.

All net migration in chapter A is compiled by Eurostat by taking the difference between total and natural population increases. This assumes that any movement of population not attributable to natural change (births and deaths) is attributable to migration.

## **CHAPTER C: THE EUROPEAN UNION AND ITS REGIONS**

Regional demographic statistics at NUTS II level are for 1993, the latest available year.

The sum of total population, births and deaths at regional level presented in this chapter may produce slightly different results from national totals. This is because regional breakdowns are not always fully known.

Eurostat has also calculated net migration at regional level, again using the difference between total and natural population increases. The gross rates obtained from this are set out in a new map in this yearbook.

## **CHAPTER D: THE EUROPEAN UNION IN THE WORLD**

The data on non-member countries of the European Union are generally from international organisations, in particular the United Nations and the Council of Europe.

Readers should bear in mind that different countries use different statistical systems. Data cannot be assumed to be as comparable as they are between the Member States of the European Union.

The total population may differ slightly from the sums of other chapters, due to the use of data from different years and from different sources.

New charts have been introduced to illustrate data at European level on male and female life expectancy at

PC: Population Census

birth, on total fertility rates and infant mortality rates.

## CHAPTER E: FERTILITY

Fertility rates by age and mean age of women at childbearing have been recalculated by Eurostat to the same definition, the age reached during the year of the event. This permits rates to be recombined by generation.

The procedure for conversion of rates by age last birthday to rates by age reached in the calendar year is described in a work by G. Calot *La mesure des taux en démographie – âge en années révolues ou âge atteint dans l'année civile. Incidence du choix de la définition. Application à la fécondité générale (France, 1946–1981)*, INED TRAVAUX ET DOCUMENTS No 104, 1984.

The definition of birth order differs between countries. For this reason birth order data have not been included in any single table, and the total for the Union has not been established.

The birth order published is that covering the entire reproductive life of the mother, used in Denmark, Greece, Spain, Ireland, Italy, Netherlands, Austria, Portugal, Finland, Sweden, Iceland and Norway. The birth order published for Belgium, Germany, France, Luxembourg, the United Kingdom and Switzerland is the birth order within the current marriage. France, Italy, the Netherlands, Portugal and Austria have the data in both formats.

Estimates for generations which have not yet completed their productive career are based upon the *ceteris paribus* assumption that future rates will be the same as the most recent observations.

## CHAPTER F: MARRIAGE AND DIVORCE

For first marriages, all countries except two have data by age reached during the year; Ireland and United Kingdom have data for age last birthday. First marriage rates have been recomputed by Eurostat by reference to age reached.

Divorce figures give a valuable insight into trends within individual countries. Because of the differences between countries' divorce laws, however, the comparison of divorce rates and numbers requires great circumspection

## CHAPTER G: MORTALITY

Data on life expectancy at different ages have been supplied by countries for the period 1960-80. For

years after 1985 life expectancy has been recomputed by Eurostat.

The infant mortality rate represents the ratio between deaths of children under one year and the number of live births in a given year. The neonatal and early neonatal mortality rates represent the ratio of deaths within 28 days respectively, within one week after birth, and the number of live births in a given year.

A number of countries are in the process of reviewing their definitions distinguishing between spontaneous abortion, early foetal death and late foetal death (or still-birth). Differences of definition lead to variations in the measurement of perinatal mortality (Table 3).

Perinatal mortality therefore includes still births and late foetal death after a minimum gestation period (ranging from 22 to 28 weeks according to the country) and some infant mortality (in different proportions according to the country).

Causes of death are defined on the basis of the International Classification of Diseases (World Health Organisation, 9th revision, Geneva: three-digit classification, pp. 1-42).

Causes of death (all) 001-999

- 1 Diseases of the circulatory system, of which 390-459
  - 1.1 ischemic diseases of the heart 410-414
  - 1.2 cerebrovascular diseases 430-438
- 2 Malignant neoplasms, of which 140-208
  - 2.1 malignant neoplasms of stomach, colon and anus 151, 153, 154
  - 2.2 malignant neoplasms of trachea, bronchus and lung 162
  - 2.3 malignant neoplasms of female breast and cervix uteri 174-180
- 3 Diabetes 250
- 4 Pneumonia, bronchitis, emphysema and asthma 180-486, 490-493
- 5 AIDS 042-044

External causes:

- 6 Accidents and disasters, of which: E800-E949
  - 6.1 road traffic accidents E810-E819
- 7 Suicide and self-inflicted injury E950-E959

There is now a new International Classification of Diseases (World Health Organisation, 10th revision, Geneva: three-digit classification, pp. 33-45). It is not shown here because only Denmark applied the new classification to the figures for 1994 (ICD-10).

## CHAPTER H: INTERNATIONAL MIGRATION

The quality of the data produced by the contributing states is partly dependent upon the type of

administrative system employed in the country, and upon the way it works (Table 4).

### Immigration

Immigration data generally record immigration by nationals and non-nationals. In France and Portugal, however, only immigration by non-nationals is recorded.

The immigration time series from 1960 to 1994 is complete for only five countries: Belgium, Denmark, Netherlands, Finland and Norway. Austria and Liechtenstein do not produce complete series, and those produced are not considered reliable. Greece, France and Portugal have only provided data since 1991 and 1992 respectively.

Generally, different definitions are used for nationals and non-nationals.

For nationals, the following definitions are in use; an immigrant is:

- a person coming or returning from abroad with the intention of residing in the country (Belgium, Italy, Luxembourg, Spain and Switzerland) for a minimum period (Portugal, Finland, Sweden, Iceland: 1 year; Norway: 6 months; Denmark: 3 months, but 6 months for nationals of the nordic countries; Netherlands: 1 month and as from October 1994 6 months) or to reside as an owner-occupier, tenant or subtenant (Germany);
- a person who intends to reside more than 12 months after spending the previous 12 months abroad (United Kingdom) or who is already resident having previously spent one year abroad (Ireland).

For non-nationals, the following definitions are in use; an immigrant is:

- a person arriving from abroad with the intention of residing in the country for a minimum period (Netherlands and Norway: 6 months; Iceland: 1 year) and in possession of a residence permit (Belgium, Denmark for nationals of the nordic countries, Italy, Luxembourg and Spain: 3 months; Portugal, Finland, Sweden and Switzerland: 1 year) or to reside as an owner-occupier, tenant or subtenant (Germany);
- a person intending to reside for more than 12 months after spending the previous 12 months abroad (United Kingdom) or who is already resident having previously spent one year abroad (Ireland).

### Emigration

Five countries have no data on emigration: Greece, France, Austria and Liechtenstein; Portugal provided some date since 1992 and Spain has information only on emigration of nationals.

An emigrant is:

- a person going abroad with the intention of residing there (Belgium, Denmark, Spain, Italy, Luxembourg, Iceland and Switzerland) for a minimum period (Norway: 6 months; Netherlands, Portugal, Finland and Sweden: 1 year) or a person leaving the residence previously occupied (Germany);
- a person who intends to reside abroad for more than 12 months after residing in the country for the previous 12 months (United Kingdom) or who is already living abroad but previously lived in the country for one year (Ireland).

## CHAPTER I: POPULATION PROJECTIONS

National population projections by sex and age are produced by national statistical institutes (regularly and irregularly), United Nations (every 2 years) and Eurostat (every 3-5 years). In order to present an up-to-date and internationally consistent set of demographic projections for all countries of the European Economic Area, the long-term population scenarios recently compiled by Eurostat are presented. These scenarios cover the period 1995-2050. For Switzerland the latest set of population scenarios prepared by the national statistical institute was taken.

The scenarios LOW and HIGH can be considered as plausible extremes with respect to future population growth. The scenario BASE LINE is generally very close to the latest official national population forecasts made by the national statistical institutes. Therefore, for the next 10-15 years the results of this scenario can be considered as internationally comparable "best guesses". Due to the lack of space, two other meaningful scenarios, showing the least and the most aged future population structures are not published here.

The key-assumptions used in the scenarios presented can be found in a separate table which precedes the outcomes. More detailed information is available by means of publications, diskettes and by consulting the Eurostat database New Cronos.

**Table 3: Current definitions of foetal death**

Country	Minimum gestation period	Other criteria
Belgium	26 weeks (180 days)	
Denmark	28 weeks (196 days)	
Germany	-	Foetus weight equal to at least 1000 gr.
Greece	28 weeks (196 days)	
Spain	28 weeks (196 days)	
France	26 weeks (180 days)	
Ireland	28 weeks (196 days)	
Italy	28 weeks (196 days)	
Luxembourg	28 weeks (196 days)	
Netherlands	24 weeks (168 days)	
Austria	-	Foetus size equal to at least 35 cm. <sup>1</sup> Foetus weight equal to at least 500 gr. <sup>2</sup>
Portugal	22 weeks (154 days)	and / or at least 500 gr. and 25 cm
Finland	22 weeks (154 days)	
Sweden	28 weeks (196 days)	Foetus size equal to at least 35 cm.
United Kingdom	24 weeks (168 days)	
Iceland	28 weeks (196 days)	
Liechtenstein	Not available	
Norway	28 weeks (196 days)	
Switzerland	-	Foetus size equal to at least 30 cm.

<sup>1</sup> Up to 31 December 1994<sup>2</sup> Since 1 January 1995

## CHAPTER J: HOUSEHOLDS AND FAMILIES

Despite the recommendations of the United Nations Economic Commission for Europe (1988), the data on households and families derived from the 1990/1991 round of censuses are still a long way from being comparable. Eurostat did nevertheless advise implementation of these recommendations for the 1990/1991 Community census round.

As can be seen from Table 5, the definition of "private household" differs between countries. Three types of household can be distinguished: the "household-dwelling", the "housekeeping unit" and the "housekeeping unit with family ties."

- the "household-dwelling" is defined as "the aggregate number of persons occupying a housing unit ..."
- the "housekeeping unit" is defined as all persons who "combine ... to provide themselves with food and possibly other essentials for living ..."
- the "housekeeping unit with family ties" household is defined in the same way as the "housekeeping unit," with the extra requirement of a family relationship between the individual household members – either immediate (parent, spouse or child) or more remote (cousin, nephew, etc.)

*For census purposes, the family should be defined in the narrow sense of a family nucleus, that is, the persons within a private or institutional household who are related as husband and wife or as parent and never-married child by blood or adoption. Thus a family nucleus comprises a married couple without children or a married couple with one or more never-married children of any age, or one parent with one or more never-married children of any age ... (UNITED NATIONS STATISTICAL COMMITTEE and UNITED NATIONS ECONOMIC COMMISSION FOR EUROPE, 1988).*

A lone-parent family comprises at least one child resident with one parent only (either father or mother).

International comparison is not facilitated by the differing criteria – age limits and marital status – used to define "child".

**Table 4: Sources of data on international migration**

Computerised central population register	Entry / exit form	Sample survey	Indirect sources for non-nationals <sup>1</sup>
Belgium	German Fed. Rep. <sup>2</sup>	Ireland <sup>2</sup>	Greece <sup>3</sup>
Denmark	Spain	United Kingdom <sup>4</sup>	France <sup>3</sup>
Luxembourg	Italy	Portugal <sup>5</sup>	Portugal
Netherlands <sup>7</sup>	Austria <sup>6</sup>		
Finland	Liechtenstein (for nationals)		
Sweden	Switzerland (for nationals)		
Iceland			
Liechtenstein (for non-nationals)			
Norway			
Switzerland (for non-nationals)			

1 No source available for nationals

2 A parallel source (the "Ausländerzentralregister") exists for the non-national population

3 A specific question is asked during the Labour Force Survey

4 International Passenger Survey: a voluntary survey organised at frontiers by the OPCS. Of the 100 000 persons leaving the country each year, approximately 1 000 can be regarded as emigrants, and of the 60 000 persons entering the country some 2 500 can be regarded as immigrants

5 Survey on exit migration flows of nationals and non-nationals

6 In force since 1 April 1995

7 Computerised municipal population register

**Table 5: The different concepts of private households**

Dwelling concept	"House-keeping" concept	"House-keeping" concept exclusively with related persons
Denmark	Belgium	Italy
France	German Fed. Rep.	Portugal
Finland	Greece	
Sweden	Spain	
Norway	Ireland	
	Luxembourg	
	Austria	
	Netherlands	
	United Kingdom	
	Liechtenstein	
	Switzerland	

The household concept is not applied in Iceland.

# DESCRIPTION OF EUROSTAT'S DEMOGRAPHIC DATABASE

Those who require more detailed data may obtain them from the Demographic database. Applications should be addressed to the Eurostat Information Office in Luxembourg.

The data are to be found in NEW CRONOS under the heading "Population and social conditions." A series of multidimensional tables sets out data for 19 countries: the 18 members of the European Economic Area plus Switzerland. Tables cover five major domains: main indicators, population, fertility,, mortality, marriage and divorce. How complete the

tables are depends largely on the availability of data from the relevant national statistical institutes.

Data are presented country by country and for three groups of countries: European Union (EUR 15), European Free Trade Association (EFTA), and European Economic Area (EEA).

Time series begin at 1950 and continue through to 1994. For population at 1 January, data are available until 1995.

Additional data may be extracted from the following tables:

## Main indicators

GIND	Population change: absolute numbers and crude rates
GLONGIND	Longitudinal demographic indicators (completed fertility, mean age of women at childbearing by generation, ultimate proportion of ever-married persons by sex and generation, mean age at first marriage by generation)

## Population

PJAN	Population by sex and age at 1 January
PJANSIN	Single population by sex and age at 1 January
PJANMAR	Married population by sex and age at 1 January
PJANDIV	Divorced population by sex and age at 1 January
PJANWID	Widowed population by sex and age at 1 January
PPAVG	Average population by sex and five-year age groups
PFOR	Population forecasts by sex and five-year age groups, 1995, 2000, ..., 2020 (forecasts of the National Statistical Institutes)
PFORIND	Assumptions of forecasts
PSCE	Population scenarios by sex and five-year age groups, 1995, 2000, ..., 2050 (Eurostat projections)
PSCEIND	Assumptions of scenarios

## Fertility

FIND	Indicators of fertility (proportion of live births outside marriage, total fertility rate, gross and net reproduction rate, mean age of mother at birth of child and at birth of first child)
FMONTTH	Live births by month and day
FAGEC	Live births by mother's age at last birthday
FAGER	Live births by mother's age reached during the year
FRATE	Fertility rates by mother's age (at last birthday and reached during the year)
FORDAGEC	Live births by parity and mother's age at last birthday
FORDAGER	Live births by parity and mother's age reached during the year

## **Mortality**

MAGEC	Deaths by sex and age at last birthday
MAGER	Deaths by sex and age reached during the year
MINF	Infant mortality (deaths of children under one year, under 28 days, under 7 days, stillbirths)
MINDIND	Infant mortality rates
MPROB	Mortality probabilities by sex and age
MLEXPEC	Life expectancy by sex and age

## **Marriage and divorce**

NIND	Marriage indicators (number of marriages, marriage rate, mean age at marriage, mean age at first marriage, total first marriage rate)
NMONTH	Marriages by month and day
NMSTA	Marriages by previous marital status and sex
NSINAGEC	First marriages by sex and age last birthday
NSINAGER	First marriages by sex and age reached during the year
NSINRT	First marriage rates by sex and age (at last birthday and reached during the year)
NDIVIND	Divorce indicators (number of divorces, gross divorce rate, divorce rates of married, number of divorces per marriage)
NDIVDUR	Divorces by duration of marriage

# **DESCRIPTION OF THE DEMOGRAPHIC STATISTICS 1996 DISKETTE**

This year, Eurostat has for the first time produced a diskette containing demographic statistics.

The data on this diskette are taken from the New Cronos demographic database at national and regional levels and relate to population themes: population change, population structure, regional data, fertility, marriage and divorce, mortality and population projections. These themes correspond to chapters A, B, C, E, F, G and I of the 1996 Yearbook of Demographic Statistics.

The diskette features the Yearbook information, extended to every year since 1960 for the historical

series. Distributions by single age group of the population, events, rates or probabilities are given for the last five years available.

The diskette (catalogue N°: CA-95-96-164-EN-B) is available in English only. It comes with CUB.X software and an installation manual. CUB.X is a Eurostat product - supplied free of charge - which enables the user to consult multidimensional tables, select data and export them to spreadsheets or graphics software.

## **Contents**

### **Population change**

Population change: absolute numbers and rates

### **Population structure**

Population by sex on 1 January

Population by marital status, sex and age on 1 January, 1990-1995

Average population by sex

Average population by sex and age group, 1990-1994

### **Fertility**

Fertility indicators by calendar year

Live births by marital status of mother

Live births by marital status and mother's age, 1990-1994

Fertility rates by age, 1990-1994

Live births by parity, 1960, 1965, ..., 1985, 1986-1994

Live births by parity and mother's age, 1990-1994

Fertility indicators by generation

### **Marriage and divorce**

Marriage indicators by calendar year

Marriages by previous marital status, 1960, 1965, ..., 1985, 1986-1994

First marriages by sex and age, 1990-1994

First marriage rates by sex and age, 1990-1994

First marriage indicators by generation

Divorce indicators by calendar year

Divorces by duration of marriage, 1990-1994

## **Mortality**

Deaths by sex

Deaths by sex and age, 1990-1994

Probabilities of dying by sex and age, 1990-1994

Life expectancy by sex at certain ages 1960, 1970, 1980, 1985-1994

Infant mortality: deaths of children under one year, under 28 days, under 7 days and stillbirths

Infant mortality rates

## **Population projections**

Population scenarios by sex and five-year age groups, 1995-2050 (Eurostat projections)

Assumptions of scenarios

## **Regional data (NUTS level 2)**

Area of regions

Density of average total population, 1989-1993

Average population, 1970-1993

Live births, 1980-1993

Deaths, 1980-1993

Users can also obtain additional data on diskette. Requests should be addressed to the Information Office, which will extract the data from the New Cronos database (a description of which is given on the preceding pages).

## **EUROSTAT PUBLICATIONS**

### *Statistics in Focus "Population and Social Conditions":*

- 1993-6 Population by citizenship in the EC - 1.1.1991
- 1993-7 The population of the European Economic Area in 1992
- 1993-8 Female population by citizenship in the EC - 1.1.1991
- 1993-12 International Migration Flows in selected EC countries - 1991
- 1994-1 Asylum-seekers in the EU: Better data needed
- 1994-4 The population of the European Economic Area on 1 January 1994
- 1994-7 Non-nationals form over four percent of total population in the European Union - 1.1.1992
- 1995-3 International Migration in the EU Member States - 1992
- 1995-5 Households and families in the European Economic Area
- 1995-8 The population of the European Union on 1 January 1995
- 1995-11 Acquisition of citizenship by naturalisation in the European Union - 1993
- 1996-1 Asylum-seekers in Europe 1985-1995
- 1996-2 Less than 5% of non-nationals in the European Union

1 In this table, net migration is the difference between the total population on 1 January and 31 December for a certain calendar year, minus the difference between births and deaths.  
Therefore the figures in this table include corrections and may differ from the difference between immigration and emigration.

2 Germany does not apply the residence criteria strictly, which can lead to double counting of a person away from home and occupying

another dwelling as a (sub-) tenant. This explains why the number of persons in private households is greater than the estimated total population

3 The total number of persons in private households is underestimated because some persons are not classified to a specific household and because some questionnaires were not returned

4 Belgium, Germany, and Greece do not count couples living in consensual unions as a family nuclei

5 In this context, children are of any age except for Denmark, Finland and Norway (under 18), Luxembourg (under 25), Iceland (under 15), and Sweden (under 16)

These remarks are valid for the whole chapter

6 Switzerland and Liechtenstein processed their data on a special way for Eurostat in order to respect better the international standards

Figures might slightly diverge from the national publication due to the differences in definitions

**REPORTS ON THE DEMOGRAPHIC  
SITUATION BY COUNTRY**

# BELGIUM

## Population

On 1 January 1995 the population of Belgium stood at well over 10.1 million persons. During 1994, the population increased by almost 30 000 people, or 0.3 per cent. More than 60 per cent of the increase was due to net migration.

Compared with the average annual population growth between 1985 and 1995 (almost 13 000), one could conclude that the number of inhabitants grew considerably during 1994.

The number of non-nationals continued to increase slowly despite the acquisition of Belgian nationality by almost 26 thousand of them. On 1 January 1995, 922 300 persons had a non-Belgian nationality. The share of the non-nationals in the total population remained 9.1 per cent.

Among foreign residents, Italians are the most numerous group: 213 500 (23.2%). Other important groups are: Moroccans 144 000 (15.6%), French 98 700 (10.7%), Turks 86 000 (9.3%), Dutch 75 000 (8.1%), Spanish 48 900 (5.3%) and Germans 31 000 (3.4%).

## Fertility

The drop in the number of live births, which started in 1992, continued in 1994 (116 400 in 1994 compared with 121 000 in 1993). The total fertility rate decreased from 1.59 to 1.55; a level similar to that of ten years ago.

## Marriage and divorce

There was a further slight reduction in the number of marriages in 1994 (52 000 compared with 54 100). The crude marriage rate dropped from 5.4‰ to 5.1‰; the lowest level since World War II. If current age specific first marriage rates would persist, around 54 per cent of the men and around 58 per cent of the women would marry once.

The number of divorces increased slightly (22 000 compared with 21 600).

## Mortality

The number of deaths fluctuated around 105 000 per year since 1987. In 1994, it was a relatively good year: less than 103 600 people died.

The life expectancy of life at birth increased from 73.0 to 73.4 years for men and from 79.9 to 80.1 years for women. Therefore, male excess mortality diminished somewhat.

Ten years ago life expectancies were about 2 years lower.

The infant mortality rate continued to decrease to a level of 7.6‰. This level is almost 25 percent lower than in 1984.

## Migration

Net migration in 1994 (+18 000) was slightly lower than in 1993 (+19 000). Net migration had been virtually nil from 1984 to 1988, thereafter positive, reaching a peak of almost 26 000 persons in 1992.

## Government measures and legislation on population

A law dated 24 May 1994, published in the *Moniteur Belge* on 21 July 1994, introduced a "waiting list" for refugees. This law came into force on 1 February 1995, from which date onwards, each municipality must keep, in addition to the population register, a waiting list. In this list, they are recorded, at the place where they have their principal residence, foreign nationals who have declared themselves to be refugees or are applying for recognition of their refugee status. The list also includes accompanying family members.

The waiting list is centralised in the national register and contains, in addition to the information normally contained in the national register, information on the development of the administrative situation of the persons seeking asylum.

The foreign immigrants on the waiting list are not included in the population figures. This list has been established to improve the registration and monitoring of refugees, and since these people generally settle in the major cities, registration has been spread over all the municipalities in the country with a view to a fair distribution of the workload.

# DENMARK

## Population

The population of Denmark on 1 January 1995 amounted well over 5.2 million people. The population increased with 19 100 or 0.36% in 1994. Nearly 55% of the growth was due to net immigration (10 300).

In 1993 population growth was slightly lower (0.30%). In this year more than two thirds was generated by migration.

With a few exceptions the annual growth of the Danish population has been below 0.3% since around the middle of the 1970s and was even negative at the beginning of the 1980s. In the same period both natural increase and net immigration fluctuated considerably. For example, natural increase was negative during the period 1981-1987.

## Fertility

The number of live births for 1994 showed a significant increase compared with the preceding year. In 1994 the number of live births amounted to 69 700 (1993: 67 400), generating an increase in the total period fertility rate from 1.75 to 1.80.

An outstanding feature of the present demographic situation in Denmark is the sharp decline in fertility since 1966. The total period fertility rate declined from 2.62 in 1966 to 1.38 in 1983. The decrease in fertility coincides with an increase in the mean age of women at first birth. In the following period there has been a recovery of fertility, partly resulting from shifts in the timing pattern of births inside generations. However, the present level of fertility is still nearly 13% too low to ensure reproduction of population.

As a result of the significant increase in the number of consensual unions since the 1960s, the proportion of live births outside marriage has grown from around 10% to 47%.

## Marriage and divorce

The number of marriages rose considerably from 31 600 in 1993 to 35 300 in 1994. The total first marriage rate for women increased from 59% to 67%.

The number of divorces increased slightly (from 13 000 in 1993 to 13 700 in 1994). Since the middle of the 1960s Denmark has experienced major changes in formal family patterns: a sharp decline in entrance to legal marriage and an increasing incidence of dissolution of legal marriage by divorce. However, due to a drastic increase of the number of consensual unions, changes of the proportion of legal and consensual unions in the single age-groups have been moderate.

## Mortality

In 1994 61 200 people died, 1 600 less than in 1993. Life expectancy at birth increased somewhat reaching 72.8 years for men and 78.0 years for women. During the period 1976-80 the values were 71.2 years and 77.2 years respectively.

The infant mortality rate in 1994 was with 5.6% slightly higher than in 1993.

In 1994 two thirds of the deaths was caused by cancer and diseases of the circulatory system.

# GERMANY

## Population

At the end of 1994, Germany had a population of well over 81.5 million, which was 201 000 (or 0.2%) more than at the beginning of the year. The increase was relatively moderate compared with the population growth in 1993 (364 000) and 1992 (700 000). This recent slowing down of population increase is mainly due to a decline of net migration from 776 000 in 1992 to 462 000 in 1993 and 316 000 in 1994. Natural increase became more negative. The number of births minus the number of deaths decreased from -76 000 in 1992 to -99 000 in 1993 and -115 000 in 1994.

Net migration of non-nationals reached a peak in 1992 of almost 500 000. Thereafter the net inflow dropped from 279 000 to 132 000, a level similar to those measured in 1986 and 1987.

As a consequence, the growth in Germany's foreign population continued to decline. There were almost 7 million non-nationals permanently resident in Germany at the end of 1994, 112 000 (2%) more than at the end of 1993. During the period 1992 and 1993 foreign population grew with 489 000 and 382 000 persons respectively.

Non-nationals accounted for 8.6% of Germany's total population at the end of 1994.

## Marriage and divorce

The number of marriages declined in 1994 for the fourth year in succession, to 440 000, 0.5% fewer than in 1993. Crude marriage rate decreased slightly from 5.5‰ to 5.4‰.

The average age at which people married for the first time continued to increase, to 28.9 years for men and 26.3 for women.

Once again, the share of men and women who had been divorced or widowed prior to remarrying was higher than the year before. 22.6% of men and 23.4% of women who married in 1994 had already been married.

As in the two previous years, there were conflicting marriage trends in western and eastern Germany. There was a 1.4% decline compared with 1993 in the number of marriages in the territory of the pre-unification FRG. In the new *Länder*, by contrast, the upward trend of 1993 continued, with an increase (from what was still a very low base) of 6.5%. Compared with 1990, however, the number of marriages contracted in 1994 in the new *Länder* was only just over half the number recorded in 1990.

The fall in the number of new marriages coincides with a rise in the number of divorces. 166 000

marriages were dissolved in 1994: 6.2% more than in the year before. 135 000 minors were affected by their parents' divorce. The long-term divorce rate is nearly 30%, i.e. if the current marriage duration specific divorce rates continue, about 30% of all marriages will have been dissolved within 25 years. As in previous years, most applications for divorce were made by women.

## Fertility

The number of live births in 1994 was 770 000 (3.6% fewer than in 1993). This is a new record low in post-war Germany, the previous low-point having been in 1975. Total fertility rate continued to decrease. In 1994 a level of 1.26 was reached, which is almost 0.2 lower than in 1990.

A major contributing factor were the new *Länder*, where the major upheavals since 1989/90 have caused very rapid falls in the number of new marriages and births. For the first time since unification, however, the annual decline in the number of live births in the new *Länder* (at -2.3%) was smaller than in the territory of the pre-unification FRG (-3.8%). Total fertility rate in the new *Länder* probably stabilized at what is a very low level (1993: 0.77).

The average age at which married women gave birth to their first child was 27.8, thus continuing an upward trend which has been observed for some time. The proportion of children born out of wedlock continued to increase, to 15.4%. The number of live births of non-nationals declined slightly (101 000 as against 103 000 in 1993) for the first time since 1985 (in the pre-unification FRG).

There were 22.4 million families in Germany in April 1994. Of these, 8.9 million comprised married couples with no children and 13.5 million couples or single persons with children.

## Mortality

The number of deaths, which had risen in 1993, declined again in 1994 to 885 000. This implies that there were 115 000 more deaths than live births. This deficit is attributable almost in full to women (102 000 more females died than were born). The reasons for this can be found in the age pyramid: there are considerably more women than men in the older age groups, because of the higher number of men who fell in the Second World War.

In 1994, life expectancy at birth in Germany for boys and girls was estimated at 73.1 and 79.6 years

respectively. In 1990 the values were well over 1 year lower.

The 1994 figures for 60-year olds were almost 0.8 years higher than in 1990: 18.2 years for men and 22.5 for women. The upward trend in life expectancy therefore continued and is mainly due to a further decrease of the mortality rates among the elderly.

The rate of infant mortality continued to fall in 1994: 5.6 out of every 1 000 children born alive died in their first year. Ten years before, the level was 9.1.

Finally, the significant increase in the number of still births in 1994 (3 100) compared with 1993 (2 500) was due to a change of definition: the minimum weight above which stillborn children are registered was reduced from 1 000 grams to 500 grams.

## Migration

By far the biggest factor behind the decline in net migration is the trend in foreign immigration to

Germany. 795 000 non-nationals migrated to Germany in 1994: 195 000 (20%) fewer than in 1993. A contributing factor was the smaller number of asylum seekers: 127 000 persons applied for asylum in Germany in 1994, compared with 323 000 in 1993. The main reason was that fewer applications for asylum were made by persons from Romania and the former Yugoslavia.

Since 1987, the number of non-nationals leaving Germany had been on a rising trend. However, this came to an end in 1994, when 663 000 departures were recorded: 47 000 (7%) fewer than the year before.

Consequently net migration of non-nationals dropped from 279 000 in 1993 to 132 000 in 1994, a level similar to those measured in 1986 and 1987. In 1992 a peak was recorded of almost 500 000. The biggest net inflows in 1994 were from other European countries (111 000), comprising most notably migration from Bosnia-Herzegovina (52 000), the European Union (23 000) and Turkey (18 000).

# GREECE

## Population

At the end of 1994, the population of Greece stood at well over 10.4 million persons. During 1994, the population increased by 33 200 people, or 0.3 per cent. More than 85 per cent of the increase was due to net migration.

Compared with the average annual population growth between 1985 and 1995 (49 000), one could conclude that the number of inhabitants grew moderately during 1994.

During this ten-year period the age structure underwent significant changes. The proportion of children aged 0-14 in the total population fell from 22% to 17%, whilst the proportion of persons of pensionable age (65 and over) increased from 13% to 15%. Expressed in terms of relative population change, the number of persons aged 0-14 dropped with 15%, whilst the number of elderly grew with 21%.

The number of non-nationals decreased from 158 300 in 1993 to 149 100 in 1994. In the beginning of the 1980s there were not more than 100 000 foreign citizens living in Greece. The breakdown of foreign residents by nationality shows that most are from Europe (57%).

## Marriage and divorce

After the strong increase in 1993 (+13 600 or 28%), the number of marriages dropped with 5 400 or 9%. The crude marriage rate fell from 6.0 to 5.5, apart from 1992 (4.7) the lowest level since the beginning of the 1980s.

The total first marriage rate for both women and men showed a somewhat fluctuating but downward trend during the last 10 years. For women it reached a level of 67 per cent in 1994. This trend has had a negative effect on the number of births.

The average age of women at first marriage has increased gradually but steadily, from 23 years in 1985 to 25.3 in 1993 and 25.6 in 1994.

The number of divorces decreased slightly in 1994. The crude divorce rate remained at a relatively low level of 0.7 per cent. If current marriage duration specific divorce rates would persist, around 12 per 100 marriages would end in a divorce. Ten years ago similar levels were recorded.

## Fertility

The number of live births increased with 2 000 or 2 per cent. The total fertility rate showed for the first

time since the mid 1970s a slight recovery (from 1.34 in 1993 to 1.35 in 1994).

The average age of mothers at first birth, which started to rise in 1985, continued to increase. The same applies for the proportion of live births outside marriage.

## Mortality

The number of deaths remained almost constant. Life expectancy at birth continued to increase. For the first time the values for men and women exceeded 75 and 80 years respectively. Ten years ago the levels were about 2 years lower.

The infant mortality rate gradually declined, the steady annual decrease bringing the figure down from 14.1 deaths per 1 000 live births in 1985 to 8.5 deaths in 1993 and 7.9 in 1994.

As regards the causes of death during the last ten years, heart disease was in first place, followed (in decreasing order) by neoplasm's, cerebrovascular diseases and diseases of the respiratory system, fifth position being held by accidents.

## Migration

Statistics on migratory flows in Greece are basically compiled from the residence and work permits granted to foreigners and on basic census forms. Also the ten-yearly population censuses provide data. In addition to official immigrants, it is estimated from various sources (mainly the press) that there is a significant but unverifiable number of illegal immigrants in Greece, mainly economic refugees from neighbouring and other countries.

For 1994 a net migration of 27 200 persons was estimated, almost 29 000 less than in 1993. The highest net inflow since 1985 was recorded in 1991 (87 200).

The number of asylum seekers increased slightly (from 900 in 1993 to 1 100 in 1994). Here the peak year was 1990 with 10 600 persons.

## Government decisions and legislation

No new legislation on maternity protection or demographic policy in general was adopted in 1994. However, the framework legislation introduced in 1990 remains in force. This provides, *inter alia*, for monthly payments to mothers having a third child, and a life pension for mothers with five or more children.

# SPAIN

## Population

At the end of 1994 the estimated population was 39.2 million persons, 60 000 or almost 0.2 per cent more than at the beginning of the year. During the period 1985-1995 average population growth amounted well over 83 000 persons, whilst around 1980 it was around 400 000 persons. The main reason why population growth has decreased so drastically, is the steep decline of fertility since the end of the 1970s.

As a consequence the percentage of children aged 0-14 in the total population decreased from 26% in 1980 to 17% in 1995. The proportion of persons aged 65 and over increased from 11% to 13%

The number of foreign citizens living in Spain increased strongly from 393 000 in 1993 to 430 000 in 1994. However, this group still makes no more than 1.1% of the total population.

## Marriage and divorce

The number of marriages continued to decrease. In 1994 well over 196 000 marriages were contracted, 5 400 less than in 1993. The crude marriage rate went down from 5.2% to 5.0%, a postwar new record low.

(Other nuptiality indicators for 1994 were not available at the time that this report was made).

## Fertility

The number of live births went further down. During 1994 365 100 babies were born, well over 20 000 or 6% less than in 1993. The total fertility rate decreased from 1.25 to 1.22, a new record low. In 1980 and 1985 the levels were 2.20 and 1.63 respectively.

The average age of the mothers continued to increase. Fertility among young adults declined further, whilst women aged 28-36 recovered slightly. In the latest national population forecasts it is expected that this latter trend will continue so that total fertility rate will increase in the near future. For the year 2010 a level of 1.7 is foreseen so that female generations born around 1970 will ultimately get on average around 1.7 children per woman. The cohorts born around 1950 have had around 2.2 children per woman.

## Mortality

The number of deaths decreased from 339 700 in 1993 to 335 800 in 1994. Life expectancy at birth will probably increase in 1994 to a level of 74 years for men and 81.2 years for women. Since 1985 the gain in longevity for both sexes was about 2 years. However, mortality rates for the group aged 18-35, in particular males, are increasing.

Infant mortality dropped further to a postwar new record low of 6.0 per thousand. Ten years ago a level of 8.9 was recorded.

## Migration

Net migration for 1994 was estimated at 31 000 persons, which is 8 000 more than in 1993. Since 1991 net migration is positive.

The number of immigrants amounted 34 100 persons, 1 000 more than in 1993. (Data on emigration are only available for nationals (i.e. assisted emigrants) but recent figures lack).

The number of asylum seekers went down from 12 600 to 10 200.

# FRANCE

## Population

The population of metropolitan France was 58.0 million on 1 January 1995. Population growth in 1994 was less than 0.5 per cent, which was similar to the 1993 figure but slower than in previous years. The birth rate is stabilizing after falling substantially in 1992 and 1993 while the death rate, after stabilising in 1993, has continued to fall as it had done for several years previously.

Around 710 900 births and 519 600 deaths in metropolitan France resulted in a natural increase of 191 300 persons in 1994. This corresponds to approximately 12 births and 9 deaths per 1 000 inhabitants, or a natural population increase of 3%. This growth rate is similar to the 1993 figure, but slower than in the previous years. However, it is three times higher than the total for the European Union as a whole.

Immigration continued to fall in 1994. An estimated net migration of 50 000 and a population increase of 241 000 persons brought the total to over 58 million on 1 January 1995.

## Marriage

Since 1972, the number of marriages has decreased by 30% with only a brief interruption in the downward trend between 1988 and 1990. At present, it has stabilized at a very low level for the second year running - around 255 000. If women were to continue the marriage patterns observed in 1994, more than one out of every two would remain single, as in 1993, compared with one in four in 1978 and one in ten in 1973. This stop in the decline has occurred in spite of continuing unfavourable conditions.

Above all, unmarried young people are living together for longer periods, with the result that the age at the first marriage is increasing by just over three months each year: in 1994, single women married at an average age of 26.7 years compared with 25.6 in 1990. This gradual shift is not promoting an upswing in marriages: in 1994, 60% of women aged 26 were still not married compared with 29% at the same age twelve years previously.

However, non-marital union is becoming a serious competitor for marriage and cohabiting couples are gradually supplanting married couples. For example, 22% of women aged 35 in 1994 had never been married, whereas this figure was only 10% twelve years previously. Even if it is not possible to monitor cohabitation through the register of births, marriages

and deaths, the trend can be observed indirectly via the trends in births outside marriage, which comprised 10% of the total in 1979, 20% in 1985, 30% in 1990 and 36% in 1994. This new behaviour pattern is more a reflection of a lack of confidence in the institution of marriage than a questioning of shared parenthood, since in most cases children born outside marriage are recognized by their fathers, and at an increasingly early stage. Indeed, in seven cases out of ten, the father recognizes his paternity as soon as the child is born. However, couples less frequently feel the need to legitimize the child by subsequently marrying.

Furthermore, new factors have come to curb the development of marriages. For example, less-numerous generations reaching marriageable age reduces the average number of people eligible for marriage, which means that with a constant marriage rate, the actual number of marriages will inevitably fall.

Finally, policies to combat illegal immigration have been extended to include stricter controls on marriages involving foreigners. The effects of these measures made themselves particularly felt in 1994 when marriages between foreigners fell by 35% and mixed marriages by 30% compared with the maximum reached in 1991.

## Fertility

710 900 babies were born in 1994 - 700 fewer than in 1993. The birth rate has stabilized after falling substantially. Over the period 1985 to 1990, the annual number of births had been over 760 000. This figure was down in 1991, particularly as a result of an abrupt reduction in the number of births at the end of the year. This trend continued in 1992 and at the beginning of 1993, the smallest number of births being in the period from October 1993 to September 1994, with only 706 000 babies being born over the 12-month period. However, the figure started to pick up again at the end of the year.

The total fertility rate was 1.65 children per woman, as in 1993. For the third year running, this figure was lower than it had been for over 15 years, i.e. around 1.8. Over the recent period, France is one of the countries in Europe where this fertility indicator has been falling most rapidly.

This drop in the total fertility rate has coincided with a period of economic recession (1991-1993) and stagnation on the labour market. Whereas, over the last 20 years, changes in unemployment rates and

the birth rate have not always been in opposite directions, their complementary nature over the recent period cannot be totally fortuitous. Given the atmosphere of growing unease, it is likely that more and more women will have adopted a wait-and-see attitude, particularly the very young and vulnerable group, who will have decided to put off having children until the situation has improved.

The abrupt short-term fluctuations do not appear to have affected female behaviour as observed over the last quarter of the century, particularly as regards the preference for having children later and later. The extension of women's social role has been accompanied by an increase in the age at which they leave school and enter professional life as well as the age at which they get married and have children. When fertility declines, as in 1993, the reduction is particularly noticeable among very young women. When it stabilizes, as in 1994, this is because an increase in fertility among women aged 27 or over offsets the reduction among the youngest age group. The average age at which women had their first child was 28.8 years in 1994 compared with 28.3 in 1990 and 27.5 in 1985.

These gradual shifts have ultimately had little effect on the fertility rate of the generations born after the war, which are approaching the end of their reproductive life. For example, at the age of 38, the generation of 1956 had produced slightly more children than the generation of 1948 (2.07 children per woman compared with 2.06). From the age of 27 years onwards, this generation had made up a backlog of 0.16 children. The generations up to the beginning of the 1960s would also appear to have made up the backlog, but the situation is very uncertain beyond this date. For example, up to the age of 26, the 1964 generation had a very low fertility rate, with 0.8 children per woman, and at the most fertile ages (27-30 years), this generation went through periods where it did either nothing (1991-1993) or very little (1994) to make up the backlog. At the age of 30, the 1964 generation had produced only 1.34 children per woman compared with 1.58 in the case of the 1956 generation at the same age. This may be a short-term phenomenon, but a delay of this kind in the production of families increases the risk of not being able to match the fertility rates of previous generations.

Gradually postponing childbearing until a later period results in a reduction in the annual number of births. However, a new factor has come into play - the average number of women of childbearing age, since the number of births in a given year can be arrived at by applying the fertility rate at the time to this average number of women of childbearing age, which changes slowly from year to year according to a pattern which can be predicted, as it is linked to births in the past. The increase in this number slowed down

as the less-numerous generations born in 1973 and later gradually reached childbearing age. In 1993 it peaked at 430 000 women and began to drop in 1994. Since then, in terms of a constant fertility rate, the number of births has been decreasing. Thus, a minimal increase in fertility between 1993 and 1994 did not prevent a small reduction in the number of births. This effect is likely to continue because of the narrowing of the base of the pyramid.

## Mortality

There were an estimated 519 600 deaths in 1994, 12 600 (2.4%) fewer than in 1993, although in that year the number of deaths was admittedly high. If the death rate had continued at the same level from one year to the next, there would have been an increase of around 9 500 in 1994 because of the increase in and ageing of the population. Thus, after a hiatus in 1993, the fall in the death rate continued in 1994.

However, this reduction is an irregular process which must be assessed over several years. Over five years, life expectancy at birth increased by about 1½ years. In 1994, it was 73.7 years for men and 81.9 for women compared with 72.4 and 80.6 respectively in 1989. Life chances have continued to increase but more slowly over the last four years, during which the annual increase in life expectancy has been 2½ months compared with 3½ months between 1986 and 1990.

According to provisional data, almost 4 140 children died in their first year in 1994. This would correspond to a drop in the infant mortality rate from 6.5% live births in 1993 to 5.8% in 1994. The infant mortality rate has been dropping very much more rapidly since 1992. The trend in the death rate among young adults is less favourable and has even been in an upward direction for men aged between 30 and 40 for several years now. At present, the increase in life expectancy is mainly due to lower mortality among old people.

## Migration

For the second year running, there has been a reduction in emigration and immigration. Net migration in 1994 is estimated at 50 000 persons, compared with 70 000 in 1993 and 90 000 in 1992. The net migration tends to follow developments in the flows of immigrants officially registered for a long stay, the components of which have been defined by the Integration Control Board (Haut Conseil à l'Intégration).

The drop in 1993 reflected the resorption of the effects of various measures to promote immigration of workers adopted at the end of 1991 and 1992. In 1994, the drop in immigration resulted more from the

efficiency of restrictive immigration policies. Immigration fell from 94 000 to 64 000 according to the statistics of the International Migration Office and the Office Français pour la Protection des Réfugiés et Apatrides (OFPRA - French Office for the Protection of Refugees and Stateless Persons), which resulted in a downward revision of the estimated net migration.

The announcement of measures aimed at improved control over immigration (Law of 24 August 1993) appears to have discouraged applicants, since two-thirds of the total reduction was accounted for by the immigration of family members, even though the regulations on the reunification of families came into force only at the end of the year.

The employment crisis would therefore appear to have affected immigration at a later stage than fertility.

## Publications

The provisional demographic balance for the year 1994 has also been published in the January issue of the *Bulletin mensuel de statistique* (monthly statistical bulletin). The main definitive and detailed figures are published in *Insee Résultats*, under the title "La situation démographique en ...". (The demographic situation in ...). The most recent year available is 1992 (in the series "Démographie et société" No 42-43). The figures for 1993 will appear at the beginning of 1996.

The monthly figures are published in the *Bulletin mensuel de Statistique*.

- Baisse marquée du nombre de naissances", *Insee Première* No 413, November 1995
- *Insee Première "Décès 1993"* to be published in February 1996.
- *Insee Première "Mariages 1994"* to be published in February 1996.

## **IRELAND**

### **Population**

On 1 January 1995 the population of Ireland stood at almost 3.6 million persons. During 1994 population growth amounted almost 10 600, 1 600 more than in 1993. Natural increase continued to decline but net migration became less negative.

### **Marriage**

There has been a steady downward trend since 1980 in the number of marriages registered. In 1980 there were 21 800 marriages compared with 16 300 in 1994. The crude marriage rate per thousand which fell from 7.4 in the early 1970s to 6.4 in 1980 has continued to decline to 4.4 in 1993 and 4.6 in 1994.

### **Fertility**

The number of births registered in 1994 was 47 900, a decrease of 1 500 on the 1993 total of 49 500. The total number of births, declined from a peak of 74 400 in 1980 to a low of 51 700 in 1989. The annual number of births increased to 53 000 in 1990 but has fallen steadily since then.

The total fertility rate declined from 3.25 in 1980 to 2.09 in 1989. However since the 1990 figure of 2.12 the rate has decreased to 1.93 in 1993 and 1.86 in 1994.

About one in every five births was outside marriage in 1993 and 1994 compared to one in 20 in 1980. This share has been increasing steadily in recent years.

### **Mortality**

There were 30 700 deaths in 1994, compared to 31 700 in 1993 and 33 000 in 1980.

Life expectancy at birth for males increased from 72.6 years in 1993 to 73.2 years in 1994. That for females went up from 78.2 years to 78.7 years. Ten years ago the levels were around 2 years lower.

Infant mortality rate continued to decline. During 1994 almost 6 babies per thousand died before their first birthday. In 1980 a level of 11.1 was recorded. The greatest number of deaths were attributed to congenital anomalies, accounting for 33% of the total infant deaths in 1980 compared with 41% in 1994. Sudden infant deaths accounted for 17% in 1980, and 13% in 1994.

# ITALY

## Population

In 1994, the population of Italy grew from well over 57.1 million to 57.3 million: a growth of about 2.3%. This is the result of negative natural increase for the second successive year and strongly positive net migration.

Natural increase was about 20 000 more negative than in 1993 when for the first time deaths exceeded births since records began in Italy. The decline is in particularly sharp contrast with 1984, when there was a natural increase of about 27 000.

The overall increase in the population is therefore due entirely to net migration, which was estimated at 150 700 persons. This part of population growth comprises two distinct components: net movement to and from foreign countries, and the difference between the numbers of persons registering with their local authority and those deregistering. The latter component, which depends on the time lag between deregistering in one commune and registering in another, and on adjustments to the census figures, significantly increases net migration.

## Marriage and divorce

There was a significant fall in the number of marriages contracted in 1994, down from 302 000 the year before to 285 000. The marriage rate dropped to a level of 5.0 per thousand, a postwar record low. Total first marriage rate probably decreased to levels of around 60%.

The number of divorces, by contrast, went up from 24 000 in 1993 to 27 500 in 1994. This brings an end to the downward trend of recent years, which followed marked increases in the second half of the 1980s in the wake of a new divorce law. Disregarding short-term fluctuations, the levels recorded in the 1990s, however, were much higher than those seen 10 years before: in 1984, before the new divorce law came into effect, there were about 15 000 divorces.

## Fertility

The number of live births continued to fall in 1994, reaching an all-time low. There were just 527 000 live

births, 22 000 less than the year before. The total fertility in Italy was again among the lowest in Europe, at 1.22 children per woman, down from 1.26 in 1993 and 1.48 in 1984.

There was, however, a further increase in the proportion of children born out of wedlock from 7.4% in 1993 to 7.7% in 1994. Ten years ago this proportion was just 5.1%.

## Mortality

In 1994 548 000 people died, 13 000 more than in 1993. However life expectancy at birth continued to increase in 1994, reaching new records high of 74.7 years for men and 81.2 years for women. During the period 1984-1994 the gain in longevity was about 2.5 years.

Infant mortality continued to decline from 7.1 per thousand in 1993 to 6.6 in 1994. In 1984 a level of 11.4 was recorded.

## Government measures and legislation on population

Concern about population-related issues led at the beginning of 1994 to the creation of the Ministry for the Family and Social Solidarity which, in cooperation with ISTAT, set up a National Coordinating Committee to oversee Italy's activities in the United Nations International Year of the Family, and a Committee on the problems facing the elderly.

## Publications

In 1994, ISTAT published the following annual volumes on demographic issues:

1. *Le nascite e i decessi nel 1990 e nel 1991 (Births and Deaths in 1990 and 1991);*
2. *I matrimoni nel 1991 (Marriages in 1991);*
3. *Il movimento migratorio della popolazione residente nel 1991 (Migratory Movements of the Resident Population in 1991); and*
4. *La popolazione e il movimento anagrafico dei comuni nel 1992 (Population and Registered Movements to and from Municipalities in 1992).*

# LUXEMBOURG

## Population

The resident population grew in 1994, continuing the trend from the last few years. An excess of well over 1 600 births over deaths was augmented by a migratory surplus of just over 4 000. On 1 January 1995, the total population stood at almost 407 000, an increase of 1.42 per cent over the previous year.

New estimates of the foreign population were made available in late 1995. Between 1987 and 1995, the population of nationals increased only slightly, from 269 000 to around 274 000 (+1.9%). Over the same period, the number of non-nationals rose by nearly one-third. At just over 100 000, they accounted for 27.2% of the resident population in 1987. Eight years later, they numbered 132 500 (32.6%).

Nearly 60% of the new non-nationals were Portuguese, who now represent more than 12% of residents. The number of Italians, the second-largest group, remained stable at just under 20 000. Of nationals of neighbouring countries (one quarter of the foreign population in 1995), the most marked increase was among Belgians (+27.7%). Lastly, the main characteristic which distinguishes the non-nationals in the Grand Duchy from those of most other European countries is that only 10% of them are nationals from non-EU countries.

## Marriage and divorce

The number of marriages declined slightly. Total first marriage rate decreased to levels of 57% for men and 64% for women.

Judicial divorces in 1994 (700) were almost 7% down on 1993. The total divorce rate went down from 35% to 33%.

## Fertility

The number of live births continued to rise (+1.8%). The total fertility rate increased to a level of 1.72 (1.70 in 1993). The mean age of women at childbearing rose again in 1994, to 28.8 years. For several years, around 12.5% of births have been out of wedlock.

## Mortality

The number of deaths in 1994 again declined (- 3%). Life expectancy at birth went up to a level of 73.2 for men and 79.7 for women.

After a marked decline in 1993, the infant mortality rate again fell to 5.3%, a record low.

## Migration

Migratory flows remained high. With 10 145 arrivals and 6 141 departures, net immigration exceeded 4 000 persons. Portuguese nationals continued to represent the bulk of the migrants (2 400 arrivals and 1 200 departures give a balance of 1 200).

## Government measures and legislation

The government is due to present a bill on leave for family reasons, with the particular aim of assuming the burden entailed by a child's illness.

Civil service working hours are to be amended to enable working life and family life to be reconciled.

The rising number of elderly persons requiring often very expensive care led the government to set up "dependent adults insurance".

# NETHERLANDS

## Population

On 1 January 1995 the total population of the Netherlands numbered well over 15.4 million inhabitants. During the last ten years population growth amounted to on average 97 000 persons.

Population growth in 1994 amounted to 81 000, 21 000 less than in 1993.

Since the number of live births was slightly less than in 1993 and the number of deaths fell by 5 000, natural growth increased by 4 000.

Net immigration decreased from 60 000 in 1993 to 37 000 in 1994. If the (negative) growth of the so-called corrections are taken into account as well this decrease is even bigger. These (net) corrections, -18 000 in 1994 vs. -16 000 in the previous year, are mainly due to delayed processing of unreported emigration in previous years.

In 1994 the number of non-nationals in the Netherlands population registers fell by 6 000. On 1 January 1995 their number was 774 000 (i.e. 5.0% of the total population). The number of non-Dutch immigrants was 32 000 higher than the number of emigrants, while the number of non-Dutch live births exceeded the number of deaths by 12 000. However, these figures were reduced by 49 000 non-nationals who became Dutch citizens.

The largest category of non-Dutch nationals on 1 January 1995 were the Turks, followed by the Moroccans.

The number of changes of nationality (49 000) was higher than ever before. Almost half of them (24 000) were Turks. Since they are allowed to have more than one nationality the number of changes of nationality among people of this group has risen fast.

On 1 January 1994 the Netherlands population included almost 1.4 million people who were born abroad (i.e. 9.0% of the total population). 183 000 of them were born in Surinam and 65 000 in the Netherlands Antilles or Aruba. Since these two countries are former Dutch colonies almost all these people are Dutch nationals.

## Marriage and divorce

The number of marriages decreased for the fourth year in a row. In 1994 only 83 000 marriages were contracted in the Netherlands, 5 300 less than in 1993. The decrease mainly concerned marriages where at least one of the partners is not Dutch. This

decrease is related to the introduction of stricter rules concerning family formation immigration and the registration of non-Dutch nationals in the municipal population registers.

In 1994 the number of divorces rose very sharply. This is due to a rule introduced in 1993, under which divorces requested by both spouses are dealt with in a shorter period of time. In 1994 20% of the requests for a divorce were made by both partners. In 1992 this figure was only 6%.

## Fertility

There were 195 600 live born children in 1994. This number is about the same as in 1993 and 25 000 higher than in 1983, the lowest postwar level up to now. The distribution by rank did not change much, either. The total fertility rate was with 1.57 slightly lower than in 1993. The lowest level was registered in 1983: 1.47.

Extra-marital fertility continued to grow in 1994. In 1975 only 2% of all live births were out of wedlock, compared with over 10% in 1988 and 14.3% in 1994.

The number of non-married cohabiting couples who decide not to marry even when children are born is growing steadily. In 1994 their number amounted to 98 000, compared with 48 000 in 1987.

## Mortality

In 1994 the number of deaths was 133 500, which is 4 300 lower than in 1993. In 1993 this number was relatively high due to two mortality peaks, the first one in March-April and the second in November-December. Both were related to influenza epidemics. Despite a mortality surplus during the hot summer of 1994, the number of deaths is in line with the figures in former years.

According to the 1994 sex and age specific death rates, a male can expect to live 74.6 years on average, and a woman 80.3 years. Never before have these figures been so high, although the 1992 figure for women was very close. In 1984 life expectancy at birth was 73.0 for males and 79.7 for females.

## International migration

In 1994 immigration dropped sharply. For the first time in the 1990s this number remained just under 100 000 persons. During the first years of this decade

immigration was very high. In 1991 it reached a level of well over 120 000 persons, followed by 117 000 in 1992 and 119 000 in 1993. Immigration of non-Dutch nationals was hampered by the introduction of a number of measures taken by Dutch government in 1993 and 1994.

In 1983 immigration was not higher than 67 000. During the seven following years immigration showed a steady growth.

In 1994 the number of Surinamese immigrants was only one third of the 1993 figure. The number of immigrating Turks and Moroccans decreased, too. Since their number has fallen for some years this decrease cannot entirely be due to the measures mentioned above.

Some other immigrant groups showed an upward trend. The number of immigrants from Bosnia-Hercegovina rose from 3 800 in 1993 to 5 100 in 1994. In the same period the number of immigrating Iraqis increased from 2 200 to 3 100.

It should be noted that many asylum seekers who arrived in this country in 1994 were not registered in the municipal population registers before the end of the year, and were therefore not counted in the 1994 immigration statistics. Many of them will never be registered as an immigrant. On the other hand, a number of former asylum seekers who were registered in the population registers and, consequently, in the immigration statistics in 1994,

actually arrived in this country before 1 January 1994.

In 1994 the number of asylum seekers was higher than ever before (53 000, vs. 35 000 in 1993). One quarter of these came from former Yugoslavia. The number of asylum seekers from Iran, Somalia and former Soviet Union states were also high.

#### **Government measures and legislation**

In the course of 1993 and 1994 the Dutch government took a number of measures which in practice led to a decrease of the number of non-Dutch immigrants.

1. In the autumn of 1993 stricter rules for family reunification immigration and family formation immigration were adopted. These rules relate to the income, the housing situation and the duration of stay in the Netherlands.
2. Non-Dutch nationals wishing to stay in the Netherlands must have a valid provisional permit to stay in the country. This permit can only be obtained in the country of origin. Its validity is six months. Starting at 1 April 1994 this rule is applied more strictly than before.
3. Since 1 May 1994 registration in the municipal population registers cannot take place if a valid permit to stay is lacking.
4. Since 1 November 1994 a marriage may not be contracted if the sole aim is to procure a residence permit for a non-Dutch national.

# AUSTRIA

## Population

The estimated number of inhabitants for the end of 1994 is well over 8.0 million. It includes the de facto refugees from Bosnia-Herzegovina who arrived during 1992 and who have been granted preliminary stay until mid-1996. The population increase in 1994 amounted to 24 800 persons or 0.3%, i.e. less than half the growth of 1993 (53 000 persons or 0.7%), which in turn was considerably smaller than the average increment of the four preceding years (83 500 persons or 1.1%).

Despite the recent slowdown, 1994 turned out to be the seventh year in row of substantial population growth after almost one and a half decades of stagnation (1974-1987). Since the beginning of 1988 an estimated 437 400 persons were added to the population of Austria, of whom 65 400 (15%) by natural increase and 372 000 (85%) by net immigration.

The estimated number of non-nationals which was 331 600 at the end of 1987 increased to 720 900 at the end of 1994, i.e. by 117% within seven years. In the same time the proportion of the foreign population doubled from 4.4% to 9.0%. The foreign stock grew slightly less than the cumulated net immigration of foreigners amounted to. This is because naturalisations usually outweigh the natural increase of foreigners. The number of resident aliens acquiring Austrian citizenship was 11 700 in 1992, 14 100 in 1993, and 15 300 in 1994. As compared to the average foreign stock of the same year, the annual naturalisation rates worked out at 1.9%, 2.0%, and 2.1%, respectively.

## Marriage and divorce

After the big disturbances of 1987/88, the annual number of marriages fluctuated only slightly around 45 000 from 1990 to 1993. In 1994 a decrease by almost 4% to 43 300 marriages was observed. The total first marriage rate for females below the age of 50 worked out at 56%. Along with the low level of nuptiality, the trend towards later marriage continued. Women marrying for the first time in 1994 had a mean age of 25.8 years, whereas the all-time low was 22.8 years in the mid-seventies.

The number of divorces was remarkably stable from 1990 to 1993 at 16 300 while the total divorce rate increased slightly from 32.8 to 34.0 per 100 initial marriages. For 1994, however, the number of divorces (16 900) is up 4%, boosting the total divorce rate to an estimated 35.4 per 100 initial marriages.

## Fertility

Up to now, the lowest fertility in Austria was observed in 1987 with 86 500 live births and a total fertility rate of 1.43 births per woman. Then a modest increase led to a local peak of 94 600 births and a total fertility rate of 1.50 in 1991. In 1992 (95 300) and 1993 (95 200), the number of births was slightly higher, but the total fertility rate decreased again to 1.49 and 1.48, respectively. The decline in period fertility accelerated in 1994, bringing the level down to 1.44, while the number of births fell by 3% to 92 400.

The net reproduction rate for 1994 worked out at 0.69, i.e. 31% below the replacement level. Sub-replacement lasts already 23 years of which 12 years at a net reproduction rate below 0.75.

The mean age of women at childbearing which was lowest in 1978 with 26.2 years rose until 1994 by 1.3 to 27.5 years.

The number of non-marital births started to decline in 1994, but at a lesser extent than the number of marital births. Therefore the percentage of babies born out of wedlock rose further from 26.3% in 1993 to 26.8% in 1994. Also the number of births to foreigners, which had tripled from 1985 to 1993, began to fall in 1994. However, the proportion of foreign births increased slightly, from 13.6% to 13.7%.

## Mortality

Between 1988 and 1992, the number of deaths had shown little change, with an average of 83 200 per year. From this level it declined in 1993 by 0.8% to 82 500. An even stronger decrease, by 2.2% to 80 700 deaths, was observed in 1994. Life expectancy at birth increased in 1993 to 73.0 years (males) and 79.4 years (females). The further increase in 1994 made up 0.3 years for both sexes, bringing life expectancy at birth to 73.3 and 79.7 years, respectively. The difference between the two sexes which had reached 7.2 years around 1980 decreased to 6.4 years.

Infant mortality fell sharply from 7.5 per 1 000 live births in 1992 to 6.5 in 1993 and further to 6.3 in 1994, thus resuming its long-term decline which had been interrupted between 1991 and 1992.

The balance of births and deaths resulted in a smaller surplus than in the two preceding years. The total natural increase was 11 700 in 1994, 12 700 in 1993, and 12 100 in 1992. Foreign residents contributed

10 700, 11 000, and 9 800, respectively. For the Austrians, the balance has been positive during the last seven years, but declined gradually from a peak in 1991 (4 000) to 1994 (1 000).

## **Migration**

Due to the lack of comprehensive migration statistics, estimates have been prepared which rely to a large extent on stock statistics. Net immigration amounted to an average of 7 200 persons per year from 1961 to 1987. Since then (for 1988-1994), the annual average migration gain has been estimated at 53 100 persons, with the highest figures for 1991 (87 700) and 1992 (82 100). Net inflow slowed down by half in 1993 to 40 300 and further in 1994 to an estimated 13 100 persons. This was mainly a consequence of the new legislation regulating the number of foreigners and immigration which came into force on 1 July 1993.

The influx of asylum-seekers fell sharply from 27 300 in 1991 and 16 200 in 1992 to 4 700 in 1993 and 5 100 in 1994.

## **Government decisions and legislation**

Upon initiative of the Swiss and the Austrian governments, the International Center for Migration Policy Development (ICMPD) was founded in Vienna. Its main purpose is co-ordination of migration policy

issues and the development of long-term strategies in this field.

Coming into force on 1 January 1995, the term "ordinary residence" was replaced in the Austrian legal system by the term "main residence" which is defined in the Federal Constitution. The same definition with a slightly different wording in the Registration Act reads as follows (non-official translation):

"The main residence of a person is established in that accommodation in which he/she has settled with the intention, be it proven or emerging from the circumstances, to make it the center of his/her vital relations; if, under comprehensive consideration of the occupational, economic and social relations of a person, this pertinent presupposition applies to several residences, then he/she shall designate that as main residence to which he/she has the preponderant relation of nearness."

The implementation of the main residence concept was seen as a prerequisite for the start of migration statistics based on administrative data from the local registration offices. For the purposes of federal statistics, migration is defined as change of main residence across the boundaries of communes. The relevant article of the Registration Act (§ 16a Meldegesetz) came into force on 1 January 1995, and the statutory regulation by the Minister of Interior on migration statistics (Wanderungsstatistik-Verordnung) on 1 April 1995.

# PORtugal

## Population

On 1 January 1995, Portugal's total population was estimated at well over 9.9 million persons. The total growth rate in 1994 was still rather low (0.2%), and natural increase and net migration each accounted for half of the increase.

Compared with 1993, 1994 saw slower total population growth as the migration surplus declined as a result of lower immigration. The natural balance increased from 8 000 in 1993 to almost 10 000 in 1994 as the number of deaths declined drastically (-6.6%) whilst the number of live births continued to fall.

The 1991 Census results indicated an average net emigration of 32 000 persons between the 1981 and 1991 censuses. This took account of migration as well as errors in the Census coverage, estimated at 1%. In 1994, net migration was estimated on the basis of census information on previous residence from INE surveys and the statistics of several host countries to Portuguese emigrants. The estimated level showed a net inflow of 10 000 persons (25 000 arrivals and 15 000 departures) against 15 000 persons in 1993 (35 000 arrivals and 20 000 departures).

The population continued to age: the proportion of persons under 15 years of age fell from 25.5% in 1981 to 18.0% in 1994 (18.4% in 1993), while the proportion of persons aged 65 and older rose from 11.4% to 14.4% over the same period (14.2% in 1993).

## Marriage and divorce

Marriage was in constant decline since 1991, falling from 71 800 to 66 000 in 1994 (68 200 in 1993). The gross marriage rate fell from 7.3‰ in 1991 to 6.7‰ in 1994 (6.9‰ in 1993).

People are marrying later. The average age at first marriage is constantly rising, whilst fertility rates continue to decline. In 1994, the average age at first marriage was 24.6 years of age for females and 26.6 for males. From 1981 to 1994, the average age at first marriage rose by 1.3 years for males and by 1.5 years for females.

Divorces increased to 13 600 in 1994 from the previous year's figure of 12 100. Crude divorce rates in Portugal have been above 1‰ since 1991, and the current rate is 1.4‰.

## Fertility

The number of live births continued to decline in 1994: 3 700 or 4% less than in 1993. The total fertility rate fell from 1.52 to 1.44, a new postwar record low. Fertility rates at all ages went down in 1994. The average age of women at first birth continued to rise, to 25.4 years of age in 1994, an increase of 1.8 years compared with the figure in 1981.

Also the proportion of live births out of wedlock continued to rise. From 9.5% in 1981 to 16.9% in 1993 and to 17.8% in 1994.

## Mortality

The number of deaths decreased significantly in 1994: 6 800 persons or 6.6%. Life expectancy at birth rose strongly from 70.6 to 71.6 years for men and from 77.9 to 78.6 for women. Therefore, male excess mortality declined somewhat.

Cerebrovascular diseases were the commonest cause of death (23% of total deaths in 1994, virtually the same percentage as in 1993), particularly among males. There was a higher incidence of malignant tumours in 1994 (19% as against 18% in 1993), and also the rate of fatal road accidents involving females increased between 1993 and 1994.

Infant mortality has declined in recent years. In 1992, it fell below 10‰ for the first time and in 1994 a level of 7.9‰ was recorded.

## Migration

The population censuses, the new surveys conducted by the national statistical institute on the immigration of foreigners and on emigration and the employment survey are currently the national sources of data for studying international migration. Analysis of the final results of the 1991 Census, analysis of the data quality, the statistics on emigrants' destinations and the new surveys enabled recent migration flows to be better quantified.

Migration played an important role in the recent increase in Portugal's population. Whereas during the 1980s and early 1990s there was always a loss of population due to migration, since 1993 Portugal probably had a net inflow. For 1994 net migration was estimated at 10 000 persons (25 000 arrivals and 15 000 departures) against 15 000 persons in 1993 (35 000 arrivals and 20 000 departures).

# FINLAND

## Population

At the end of 1994, the population of Finland was 5.1 million. The population increased by 20 200 persons over the year, of which natural growth accounted for 17 200 and net immigration for 2 900. The increase had been 2 000 more in the previous year, when natural growth had amounted to only 13 800 persons, but net immigration to 8 400. Ten years before, the population increase was 4 000 higher than in 1994, with natural growth accounting for 20 000 and net immigration for 4 200.

In 1994 the increase in population corresponded to 4‰ of the average population figure, while in the previous year it had been 4.4‰ and 10 years previously 5‰. In 1994, the natural population increase corresponded to 3.4‰ of the average population figure compared with a mere 2.7‰ in the previous year and 4.1‰ 10 years previously.

According to the most recent forecast, Finland's population will continue to grow for another 20 years or so, although the rate of growth will be decreasing all the time. In 2015 the population will begin to decrease when the annual number of deaths comes to exceed the number of births and net immigration is not enough to make up the deficit.

## Marriage and divorce

24 900 marriages took place in 1994, a few hundred more than a year before. Since 1985 the number of marriages first went down slightly. As from 1992 an increasing trend has been observed.

Divorces in 1994 numbered 13 800 compared with a thousand fewer in the previous year and well over 4 000 fewer in 1984.

## Fertility

65 200 children were born in 1994 - 400 less than in the previous year. Around 1984 similar numbers were recorded.

In 1994 there were 20 400 illegitimate births - 31% of the total. In the previous year, this proportion had been slightly smaller (30%) and ten years before only half the size (15%).

The total fertility rate in 1994 was 1.85 - the same as two years previously. In 1993 it had been 1.81. In spite of the fact that the number of births 10 years previously had been almost the same as in 1994, the total fertility rate at that time had been only 1.70. The fertility rate 10 years ago have shown a downward trend, and began to pick up again in 1988.

## Mortality

In 1994 48 000 people died - 3 000 fewer than in the previous year, when the death rate was exceptionally high because of a virus epidemic. In 1984 there were 3 000 fewer deaths than in 1994.

Circulatory disorders accounted for 22 800 deaths in 1994, or 48% of the total. The second major causes of death were cancers, which accounted for 10 000 deaths or 21% of the total.

Infant mortality in 1994 was 4.7‰ - slightly up on the previous year when it had been 4.4‰. Ten years before the infant mortality rate had been as high as 6.5‰.

In 1994, life expectancy was 72.8 years for men and 80.1 for women - both figures 0.7 higher than in the previous year. 10 years before life expectancy had been 2.4 years less for men and 1.4 years less for women.

# SWEDEN

## Population

At the end of 1994 the population of Sweden stood at 8.8 million persons. The increase in 1994 was 71 300 persons or 0.80 per cent. The increase was the highest registered since 1970 and it was 18 200 persons more than in 1993. The natural increase was 20 400 persons, almost 1 000 more than in 1993. The unusual high population growth was more a result of high net immigration, especially from former Yugoslavia. The net immigration was 50 900 persons, the highest ever registered. Compared with 1993, the net inflow increased with almost 19 000 persons.

## Marriage and divorce

The number of marriages in 1994 was 34 200, 200 more than in 1993 when one of the lowest levels since 1915 was recorded. The highest number during the last ten years was in 1989 (108 900 marriages). The marriage-boom of 1989 was concentrated towards the end of the year. Changes in the rules for future pensions to widows could explain most of the increase. In 1990 the number of marriages dropped to a more normal level of 40 500 and since then declines and stagnations have alternated.

The average age at first marriage continued to increase to a level of 30.8 years for men and 28.5 years for women. During the last decade the highest values were recorded in 1989: 32.8 years for men and 30.4 years for women.

Also the number of divorces increased further. In 1994 22 200 marriages ended in a divorce, 600 more than in 1993 and the highest number since 1975. In the 1980s the number of divorces was relatively stable around a level of 19 000. Since 1989 divorces increased. Based on marriage duration divorce rates observed in 1994, almost half of the marriages would end in a divorce.

## Fertility

In the last fifty years Sweden has had three periods of high fertility: the middle of the fourties, the middle of the sixties and the beginning of the nineties. In 1983 there was an extremely low number of live births in Sweden, 91 800 children. During 1984-1990 the number of live births however increased to reach a level of 124 000 in 1990. Thereafter a period of decline has started. In 1994 112 300 children were born, 5 600 less than in 1993.

At the beginning of the century about every tenth live birth had an unmarried mother. The situation was about the same until 1960. During the sixties another pattern began to appear. It became more common to live together without marriage. In 1970 nearly 20% of all live births were extra-marital births. The corresponding figure for 1980 was nearly 40%. In 1994 51.6 per cent of all live births had an unmarried mother.

In the beginning of the 1980s the total fertility rate was very low. In 1983 a level of only 1.61 children per woman was recorded. Since then the total fertility rate has increased. In 1990 a new peak of 2.13 was reached. In 1994 the total fertility rate dropped to 1.88, however, still among the highest in Europe.

## Mortality

During 1994 well over 91 800 people died, 5 200 less than in 1993. Life expectancy at birth increased to a level of 76.1 for males (probably the highest in Europe) and 81.4 for females (one of the highest). Since 1985 for both sexes an increase of more than 2 years is recorded. For men this is the largest increase since the 1950's. Since the beginning of this century males have improved their life expectancy at birth with nearly 22 years and females with 25 years.

In the mid-18th century every fifth child never survived its first year. In Sweden today death before the age of one is rare. Only five of 1 000 live born children die during their first year and half of these deaths occur in the first week of their life. Boys have a slightly higher infant mortality rate than girls.

More than half of all deaths are due to some disease in the circulatory system. This has been the most common cause of death since early 1920's. The second most common cause is cancer.

Among boys and young men physical injuries account for the majority of deaths. Among the elderly it is above all the diseases of the circulatory organs and tumours that lead to death. Tumours are a more common cause of death among middle-age women than among men. Death caused by physical injury is very rare among girls and young women.

## Migration

In the period 1983-1989 the net migration increased. The increase of the net migration depended on rising immigration and relative stable emigration. At the end

of 1989 the government in Sweden took a decision that further limited the immigration and in 1990 the net migration began to decline. In 1993 however, the net migration began to rise again and the trend continued in 1994. The total net migration was 50 900 persons compared with 32 100 in 1993.

The total immigration to Sweden in 1994 was 83 600 persons. The largest number of immigrants came from former Yugoslavia, particularly from Bosnia-Herzegovina with 25 700 persons. The immigration from the Nordic countries and from countries outside Europe has increased in 1994. More than 8 900 Swedish citizens were returning to Sweden.

The total emigration from Sweden was 32 700 persons. More than half of them were Swedish

citizens. Nordic citizens returning home was also a large group. There were more Nordic citizens that emigrated from than immigrated to Sweden.

# UNITED KINGDOM

## Population

The population of the United Kingdom continued to slowly increase, reaching 58.4 million persons in mid-1994. Between mid-1993 and mid-1994 the population increased by just over 200 thousand people, or 0.35 per cent. More than half the increase (111 thousand) was due to natural change, the excess in the number of births over the number of deaths.

The rest of the increase was largely accounted for by net migration which contributed 74 thousand to the population growth. The provisional estimate of migration for the UK for 1994 is a net inflow of 109 thousand.

Some 6.6 per cent of the population was aged under 5 years; 12.8 per cent was aged 5-14 years; 42.4 per cent was aged 15-44 years; 22.4 per cent was aged 45-64 years and 15.7 per cent was aged 65 years and over.

One of the more significant demographic changes has been the increase in the very elderly population, reflecting decreases in mortality rates. Thus, for example the 1 million or so people aged 85 years and over in 1994 comprised 1.7 per cent of the total population. The corresponding proportions were 1.1 per cent in 1981 and 0.9 per cent in 1971.

The total population of the United Kingdom is projected to increase to 59.5 million in 2001, 60.5 million in 2011 and 61.1 million in 2021. However, after 2023 the population is projected to fall, so that by 2064 the projected population is some 5 million fewer than in 1994. The major change in the most recent (1994-based) national population projections is a reduction in the assumed medium/longer-term total period fertility rate and completed family size, from 1.9 to 1.8 children per woman.

## Marriage and divorce

For every two marriages in the United Kingdom in 1993 there was one divorce. (342 marriages and 180 thousand divorces). The indications are that there was a further fall in the number of marriages in 1994. For England and Wales, the number of divorces in 1994 fell for the first time since 1989; the decline between 1993 and 1994 was 4 per cent (provisional).

## Fertility

During 1994 there were 751 000 live births compared with 762 000 in 1993 and 730 000 in 1984. About 3 in every ten births were outside marriage. The actual figure for 1994 was 32.0 per cent, compared with 31.8 per cent in 1993 and 17.0 per cent in 1984.

The total period fertility rate has oscillated around 1.8 for over a decade, though there has been a decline in the last two years, to 1.75 in 1993 and 1.74 in 1994. This level is not greatly different from the low point of 1.69, reached in 1977; but compares markedly with the high rates of the early 1960s, when a fertility rate of approaching 3 was seen.

## Mortality

The dramatic decline in infant mortality seen over the recent past still continued in 1994. There was an average of 6.3 infant deaths per 1 000 births in 1993 compared with 6.2 in 1994 and 9.6 in 1984. More generally, there were 626 000 deaths in 1994 (10.7 per 1 000 population) compared with 658 000 in 1993 or 11.3 per 1 000 population.

The expectation of life at birth based on mortality rates in 1994 was 74.2 years for men and 79.4 years for women. The corresponding statistics for 1984 were 71.7 years for men and 77.6 years for women. Among adults the picture on causes of death varies between age and sex groups. For the adult population as a whole, approximately one quarter of deaths are due to cancer and one quarter results from heart disease.

## Publications

There are a variety of publications containing demographic information, including Annual Reference Volumes compiled by the Office of Population Censuses and Surveys, and the annual reports of the Registrars General for Scotland and Northern Ireland. A major publication containing key statistics for the United Kingdom, is the quarterly OPCS publication Population Trends, issue 82 (Winter 1995) contains a review of 1994.

# ICELAND

## Population

The population of Iceland stood at almost 267 000 at 31 December 1994, showing an increase over the year of 1 900 or 0.7 per cent. In 1994 the number of live births fell by 4 per cent from the previous year. A larger negative balance was seen for external migration.

During the past decade, since 1985, the population has grown 11 per cent or on average 1.1 per cent per year. The processes of dejuvenation and ageing continued. The proportion of children aged 0-14 years in the total population has fallen from 26.3% to 24.6%. The share of the elderly aged 65 and over has risen from 10.2% to 11.1%.

Among children under 16 years of age 85% were in a family of two grown-ups, including 63% in a married couple family and 22% in a consensual union family, while 16% were living with a lone parent.

The number of foreign citizens was well over 4 700 or 1.8% of the population at the end of 1994. Among these almost 4 000 had also been born abroad. To a considerable extent foreign citizens in Iceland are partners in mixed Icelandic/foreign families or children thereof. In recent years, however, the immigration of single persons and families taking up work in Iceland has become increasingly prominent. Since 1982 citizens of other Nordic countries are free to work in Iceland without a permit. Furthermore, Iceland joined the European Economic Area 1 January 1994.

The number of persons born abroad was almost 10 600 or 4.0% of the population. This group includes those born to Icelandic parents while they were temporarily studying or working abroad.

## Marriage and divorce

The number of new marriages rose some 10 per cent in 1994, estimated at over 1 350. In 1993, 61% of the spouses were already registered as cohabiting, while 88% state existing cohabitation to the marriage officer. The mean duration of cohabitation preceding marriage is 4.0 years for those stating cohabitation of less than 10 years.

The absolute number of new marriages has declined by 32 per cent since 1974. This conceals, however, a much more drastic reduction in age-specific marriage rates, which have fallen by over 60 per cent since the late 1960s. The decline in marriage rates has affected all age groups equally.

Concomitant with the decline in marriage rates, the registration of consensual union has increased. In 1994, about 2 300 new consensual unions were registered, while some 750 were discontinued. The number of registered consensual unions at the end of 1994 accounted for 20% of the combined number of marriages and consensual unions.

Divorce rates are fairly stable at about 10 or 11 divorces per thousand married women and an estimated total of 520 divorces in 1994.

## Fertility

Live births were about 4 400 in 1994, 4 per cent below the average for 1989-1993. The total fertility rate is estimated at 2.14, 11 per cent above the level of 1985-86.

In 1994 births to women living with the (biological) father were 90% of the total, including 40% to married women and 50% to women in consensual union at the time of birth. As for first births, 18% were to married women, 65% to women in consensual union, and 17% to other women.

## Mortality

Deaths in 1994 amounted about 1 700, slightly below the five-year average for 1989-93.

Life expectancy at birth reached new postwar records: 75.2 years for men and 81.2 years for women.

Infant mortality rates may fluctuate from year to year due to the small size of the population. For 1994 a very low level of 3.4 per thousand live births was recorded.

## Migration

Historically, while there have been swift changes in the direction of external migration, Iceland is a country of net emigration. In 1994 immigration and emigration involved 2 700 and 3 400 persons, respectively, corresponding to 10.1 and 12.9 per thousand population.

Icelandic citizens accounted for 67% of immigration and 77% of emigration. Net emigration of Icelandic nationals was almost 900 persons. Net inflow of non-nationals amounted just over 100 people. Principal destinations for Icelandic citizens moving abroad are Denmark, Norway, Sweden and the United States.

# NORWAY

## Population

The population of Norway numbered 4 348 400 by the end of 1994. The increase in 1994 was 23 600, or 0.5 per cent, slightly lower than in 1993. In 1984 the increase was 11 500 persons (0.3 per cent). The natural increase was 16 000, almost 3 000 larger than in 1993. This was due to relatively low mortality in 1994, see below. Net immigration was 7 400, 5 400 lower than in 1993. In 1984 natural increase was 7 000 persons, and net immigration was 4 000 persons.

## Marriage, divorce and families

In 1994, 20 600 marriages were contracted for which at least one of the spouses was registered as resident in Norway. In 1993 the number was 1 100 lower. Remarriages in which at least one of the partners is divorced represent a slowly but steadily growing share of all marriages: 18 per cent in 1994, 15 per cent in 1992 and 13.5 per cent in 1984. The mean age at first marriage continued its increase in 1994: 29.8 years for males and 27.2 years for females. Ten years earlier both mean ages were 2.8 years lower. If first marriage rates as of 1994 were to remain constant, an estimated 40 per cent of the males and 36 per cent of the females would be never-married at age 50. Ten years earlier these shares were 15 percentage points lower for both sexes.

A new law on the registration of partnerships became effective on 1 August 1993. By the end of that year 158 partnerships had been registered: 116 between male couples and 42 between female couples. One year later the numbers of existing registered partnerships had increased to 197 for male couples and 89 for female couples.

In 1994 10 900 married couples were divorced in 1994, and 12 000 separated. These numbers are largely the same as those for 1993, but compared to 1992 there were 700 more divorces and 200 fewer separations in 1993 and 1994. Per 1 000 existing marriages the divorce rate was 12.1 in 1994. In 1984 there were 8 000 divorces (8.3 per thousand) and 10 000 separations. The 1994 divorce rates would imply that 48 per cent of the marriages may end in divorce before age 65, which is 15 percentage points higher than in 1984.

On 1 January 1995, there were 844 000 families

consisting of a married couple (with or without children). The trend has been downward from 1979, when there were still 938 000 married couple families. In 1984, the number was 921 000. Since 1987, statistics on numbers of cohabiting couples with at least one common child have been compiled on the basis of the Central Population Register (CPR). On 1 January 1995 there were 74 000 of such couples, up 25 000 compared to 1989. The CPR does not give information on cohabiting couples *without* children, or with children to only one of the adults. However, the 1994 Omnibus Survey indicates that among women aged 20-24 and 25-29, 31 and 35 per cent, respectively, were cohabiting (with or without children). The corresponding figures for men are 18 and 37 per cent, respectively. An estimated 200 000 couples lived in consensual union in 1994.

## Fertility

Live births in 1994 numbered 60 400. Since 1990 the level has been stable at between 59 900 and 61 200, with a crude birth rate of 14 per thousand. In 1984, 50 300 live births were registered (12.1 per thousand). The total fertility rate has been at 1.9 children per woman during the years 1990-1994 - it was 1.87 in 1994. This is 0.21 child per woman higher than in 1984. The larger part of the fertility increase in the second half of the 1980s is explained by a catching up effect among women who earlier postponed their births. Indeed, cohort fertility still shows a falling tendency.

The share of live births outside wedlock climbs steadily: it reached 46 per cent in 1994, up by 25 percentage points since 1984. Nowadays, probably more than 3/4 of these children are born in a consensual union. Birth rates for women under 25 years of age continued to fall in 1994, whereas those for women over 30 increased again. The mean age at childbearing was 28.8 years, up by 0.1 year since 1993, and by 1.4 year since 1984.

The number of legally induced abortions was 14 500 in 1994, or 242 per 1000 live births. This implies a small decrease compared to 1993 (14,900 and 250 per 1 000, respectively). The absolute figure for 1994 is only a little higher than that in 1984, when 14 100 legally induced abortions were registered. The number rose from 13 500 to 16 200 during the years 1980-1989. Next a steady decrease set in.

## Mortality

In 1994, there were 44 100 deaths. This number is 2 500 lower than the year before, when there was an influenza epidemic. The figure for 1994 is now back at the levels registered in 1991 and 1992. The 1994 crude death rate was 10 per 1 000, and the infant mortality rate was 5 per 1 000 live births. The latter rate has shown a downward tendency since the 1980s, when it was 8 per 1 000. Life expectancies at birth were 74.9 (males) and 80.8 years (females) in 1994, the highest values ever observed for Norway. Ten years earlier, life expectancies amounted to 72.8 and 79.5 years, respectively. In that year, 42 600 deaths were registered, a crude death rate of 10 per 1 000 of the mean population and an infant mortality rate of 8 per 1 000 live births.

In 1993, 45 per cent of all deaths were caused by diseases of the circulatory system. Half of these deaths were due to ischemic heart diseases. Malignant neoplasm caused 22 per cent of the deaths in 1993. Among males cancer of lung, prostate, and colon are the most frequent cancer forms - among women cancer of mamma, colon, lung, and pancreas. Compared with previous periods, mortality from cardiovascular diseases has declined for both sexes, and that from malignant neoplasm has increased for males and females in age groups 60+ in the course of the 1970s and 1980s.

## Migration

The net immigration was 7 400 persons in 1994, which was considerably lower than the corresponding figure in 1993 (12 800), but only a little under the figures for 1991 and 1992: 8 000 and 9 900, respectively. 1993 was an exceptional year with respect to immigration, with a net immigration of 6 000 persons from Bosnia-Hercegovina. Visa requirement was introduced in October 1993. Indeed, in 1994 the figure was considerably lower: 3 100.

Nearly all net immigration originated from countries in Europe: 6 700 persons, with almost half of them coming from Bosnia-Hercegovina, as noted above. Net immigration from Sweden was 1 700, whereas there

was a net emigration to Denmark: 300 persons. Net immigration from Finland and Iceland was 300 persons in both cases, a figure that was similar to that for Russia. Concerning Europe, emigration was large to Denmark (2 700), Sweden (2 600), and Great Britain and Northern Ireland (1 700).

There were 1 400 net immigrations from Asia in 1994, mainly from the Philippines, Pakistan, Thailand, and Vietnam, with 150-200 each. Net immigration from Africa was much lower (700 persons), while it was negative (290 net emigrants) with respect to North-America. Net immigration from third world countries has been declining the last seven years.

By the end of 1994, 164 000 persons with non-Norwegian nationality were registered in the population register. Because the number of persons who changed from foreign to Norwegian nationality was higher than ever (8 800), the growth in the non-Norwegian population was quite low in 1994: 1 700 persons, as compared to 11 400 in 1992 and 13 800 in 1993. More than half of the aliens have European nationality (91 000). Denmark (18 100), Sweden (14 400) and Great Britain and Northern Ireland (11 200) are well represented. Among the Asians (43 100), persons with Pakistan nationality (10 300) are most frequent.

## New legislations

Two new laws which may have an impact on demographic trends became effective recently, one on registrations of partnership (1 August 1993, see above), and a new marriage law (1 January 1993). Same-sex couples may have their partnership registered. The new marriage law has consequences for separation and divorce. Three aspects are relevant here. First, separation can be requested by only one partner (both partners under the old law). Second, a divorce request from only one spouse can be forwarded after a separation of at least one year, irrespective whether the partners agree in divorce or not (previously two years in case of dissent, one year otherwise). Third, each spouse may request divorce in case the partners have lived separately (factual separation) during at least two years (previously three years).

# SWITZERLAND

## Population

In 1994, the permanent resident population of Switzerland grew by 0.7 per cent, or 51 900 persons, bringing it to just over 7.0 million by 31 December of that year. In 1993, the increase was still 0.9 per cent. 40% of the increase came from the excess of births (21 000 more births than deaths) and 60% from net migration (30 900 persons). The equivalent figures for 1993 were 21 300 and 39 500 respectively.

The past few years have seen the population increase level off. In the early 1990s, the annual increase was still over 1 per cent. The increase, greater than in 1994, was partly due to the slightly greater number of births, but mainly to higher immigration.

In 1994, the total number of children and young people (aged under 20) increased by 11 900 in Switzerland. The proportion of young people in the population was 23% in 1990, a figure that remained stable until early 1995.

The working age population (persons aged between 20 and 64) increased by 25 900 in 1994. Between 1990 and 1994, this category increased by 166 300.

The number of senior citizens (persons aged 65 and over) continued to increase. At the beginning of 1995, there were well over 1 million people in this age group, representing an increase of 12 700 during 1994. Since 1990 the number rose by 48 300.

## Marriage and divorce

The fall in marriages that began in 1991 continued in 1994. In 1990, 47 600 couples married. The 1994 figure, at 42 400 couples, represents a decrease of 11 per cent. On the basis of the 1994 figures, 61% of single men (under the age of 50) and 66% of single women can still be expected to marry. In 1990, the total first marriage rate peaked temporarily at 70% for men and 75% for women.

Whilst the number of marriages is falling, an increasing number of marriages are ending in divorce. Between 1990 and 1994, there was almost 19 per cent rise in the number of divorces (to 15 600). Over the same period, the total divorce rate rose from 33% to 38%.

## Fertility

In 1994, 83 000 live births were recorded, representing a decrease of 0.9 per cent over the previous year. The number of births began to rise steeply in the mid 80s, peaking in 1992 at 86 100 live births (1985: 74 700). However, the past two years have seen a new downward trend.

The total fertility rate continued to fall, 1.49 being the lowest figure ever recorded in Switzerland (1990: 1.59). For married women, this figure decreased from 1.94 in 1990 to 1.81. The fall in the total fertility rate is connected with the increase in the average age at marriage. As late marriages reduce the marital fertility rate of women, fewer children are born during the marriage.

In 1994, 25% of new-born children were of foreign nationality, compared with just 20% in 1990. There are two reasons for this trend: firstly, there has been a relatively sharp rise in the number of foreign women aged between 25 and 34 (when most women give birth), and secondly, the birth rate is still higher amongst foreign women than amongst Swiss women.

Compared with most other European countries, the number of children born to unmarried women is very low in Switzerland. In 1994, 6.4% of children were born out of wedlock, compared with 6.1% in 1990.

## Mortality

In 1994, 62 000 deaths were registered, well over 500 fewer than in the previous year. After the increase in 1993 (the first since 1990), this represented a fresh decrease. Life expectancy at birth reached new records high: 75.2 for men and 81.7 for women.

Infant mortality reached an all-time low: 5.1 deaths in the first year of life per 1 000 live births puts Switzerland on a par with the Scandinavian countries, where infant mortality is the lowest in Europe.

In spite of a decrease compared with the previous year, disease of the circulatory system is still the commonest cause of death at 43%, tumours coming a distant second at 27%.

## **Migration**

Some 27 000 Swiss nationals leave the country each year, and around 22 000 return. Numbers are evenly divided between the sexes. More than half of all emigrating or returning nationals are between 20 and 34 years old.

Immigration by non-nationals is governed by the Aliens Act and the right to asylum. It is also restricted by Federal Council policy, which aims to stabilize the number of foreign nationals resident in Switzerland and encourage their integration. Annual fluctuations in immigration and emigration are largely attributable to changes in the employment situation.

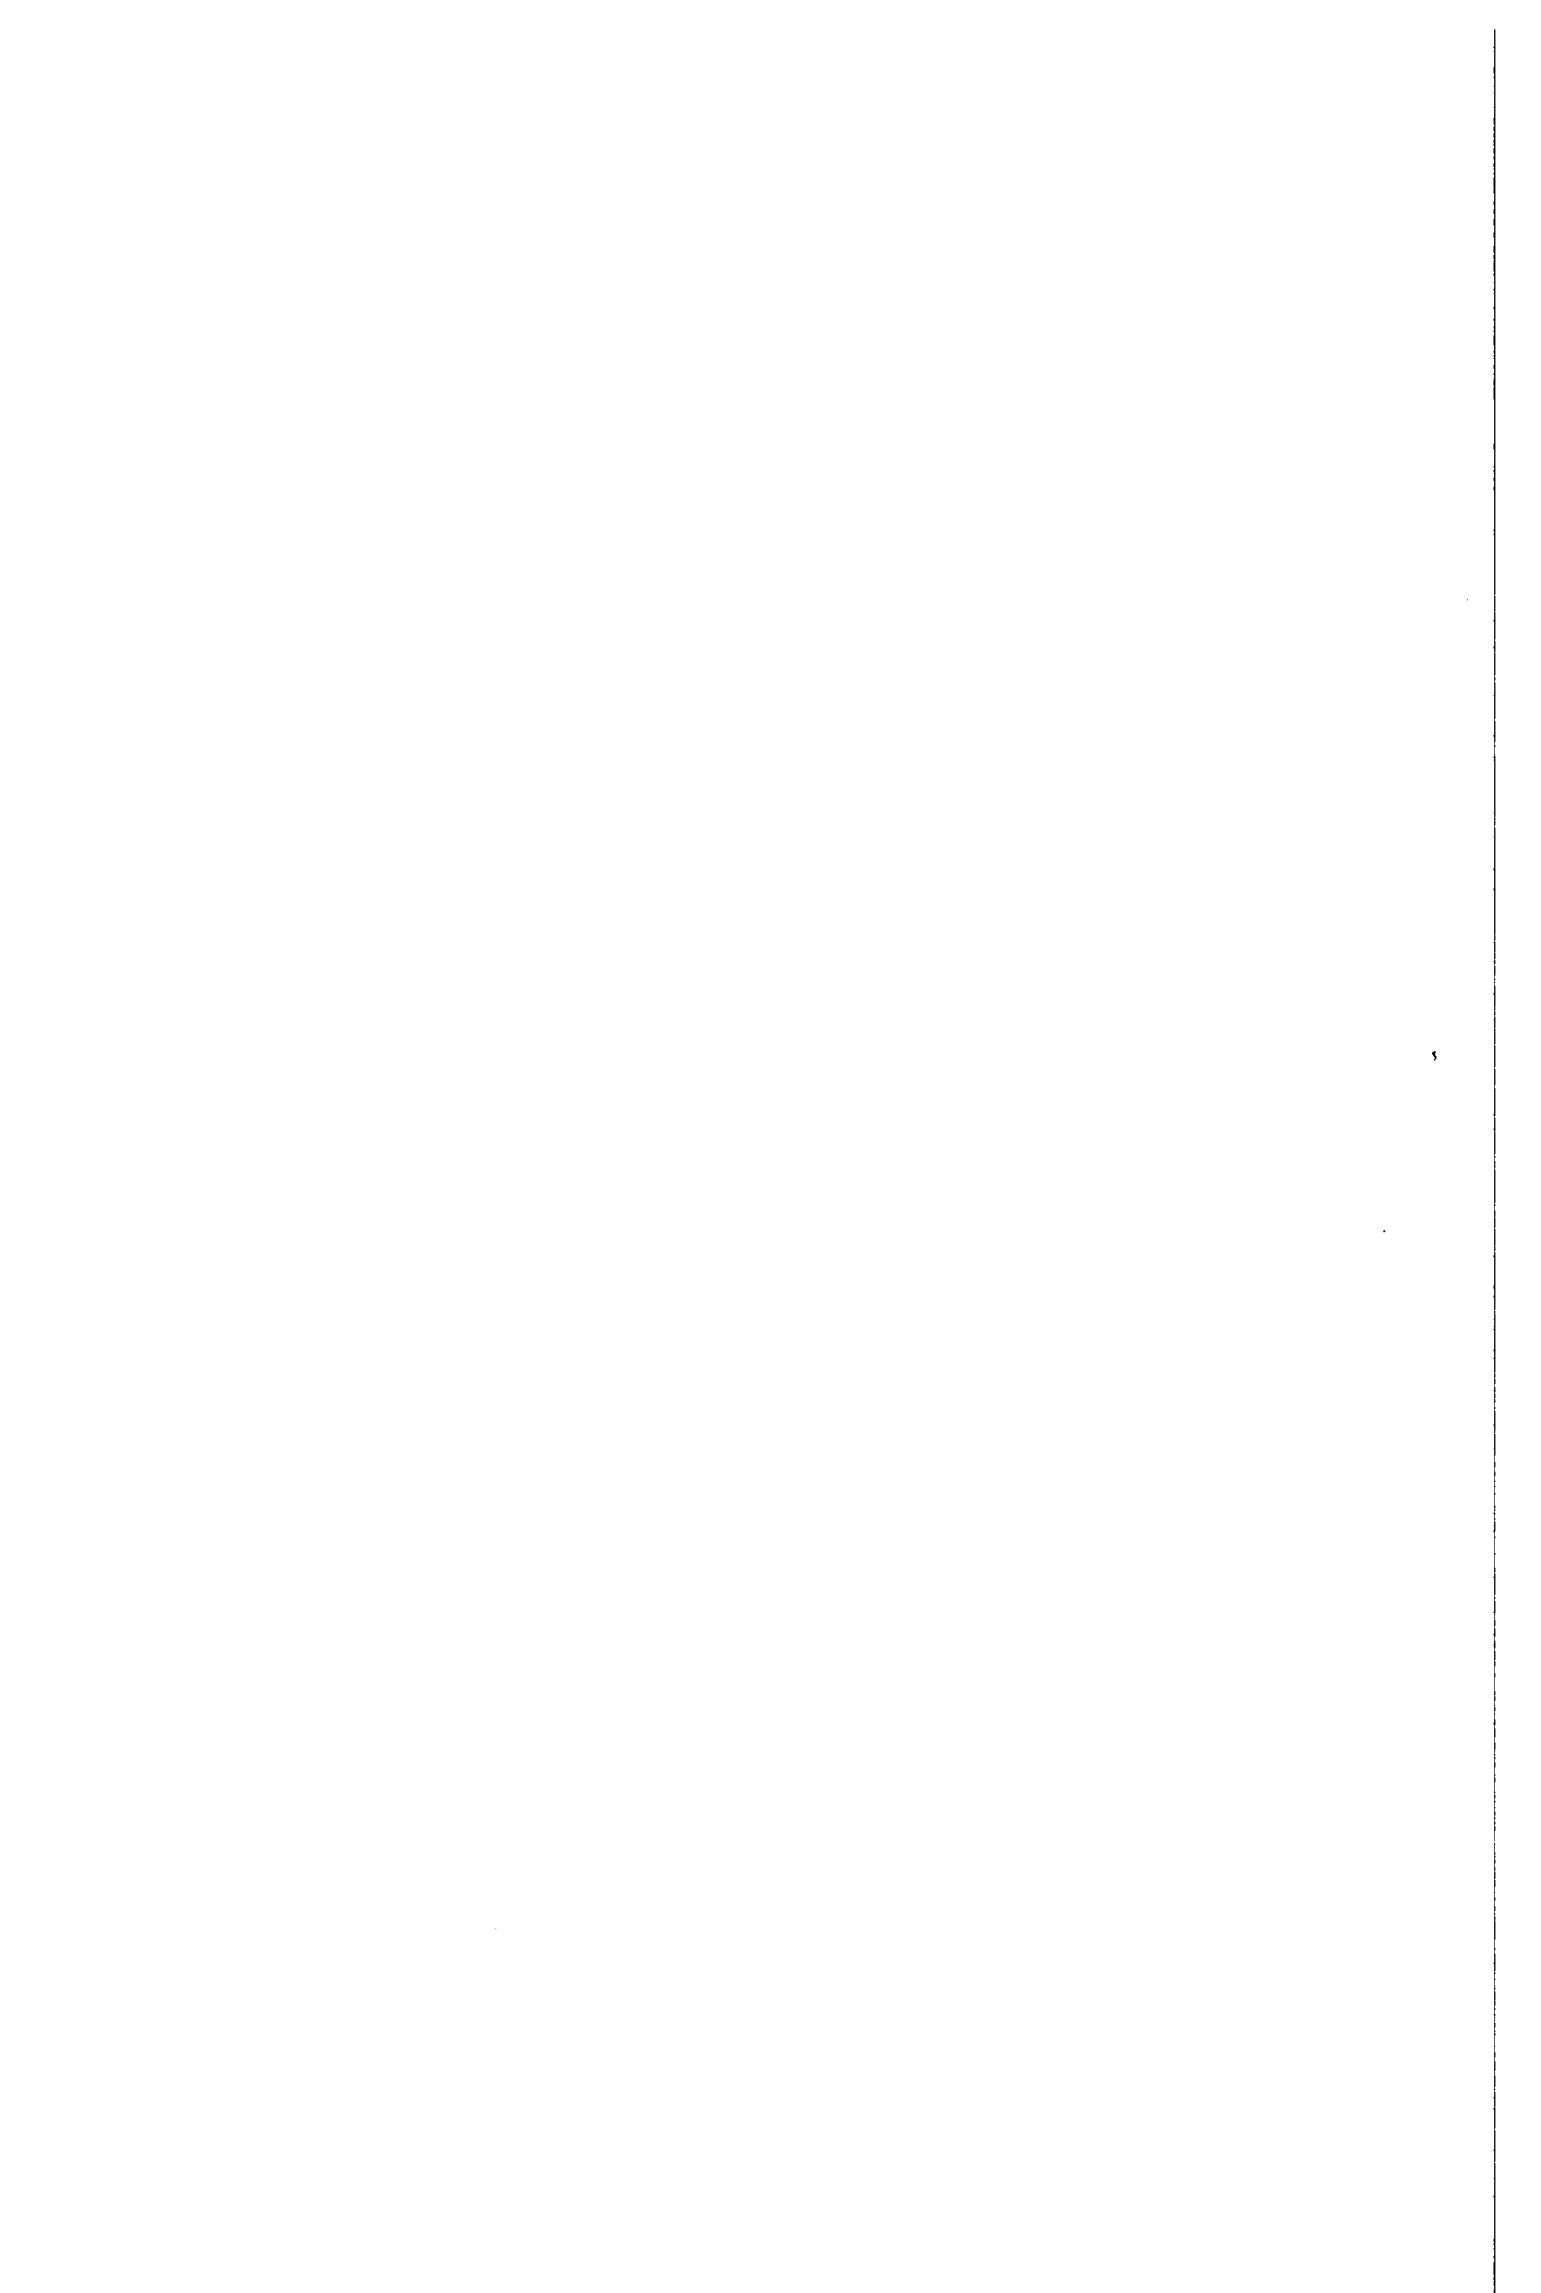

Since 1979 there has been net immigration amongst persons with one-year or permanent residence permits (the latter conferring many more rights). However, since 1991, the migratory balance has constantly fallen: in 1994, net migration was 38 000 persons, compared with 45 000 persons in 1993.

In addition to the migratory flows of the permanently resident foreign population, account should be taken of seasonal workers, asylum seekers and frontier workers. In 1994, 83 900 seasonal workers travelled to Switzerland, with an average of 42 700 in the country at any one time.

The number of asylum seekers fell from 24 700 in 1993 to 16 100 in 1994.

European Commission

**Demographic statistics 1996**

Luxembourg: Office for Official Publications of the European Communities

1996 — XXX, 249 pp. — 21.0 x 29.7 cm

Theme 3: Population and social conditions (yellow)

Series A: Yearbooks and yearly statistics

ISBN 92-827-7428-7

Price (excluding VAT) in Luxembourg: ECU 18

While all European Union countries possess highly developed systems of demographic statistics, the wide diversity of practice with regard to the publication and presentation of results makes it very difficult to obtain the comparable and up-to-date information required to study trends within the Union. This publication is designed to make good this deficiency. All the principal series of demographic statistics are covered, namely population by sex and age group, births, deaths, migration, marriages, divorces, fertility, life expectancy and population projections. Both absolute numbers and rates are given in considerable detail for each country in the Union.
