European system of integrated social protection statistics (ESSPROS)

Current expenditure and receipts 1970-1985

This bulletin is the first of a new series of social reports that Eurostat plans to publish regularly from 1989 onwards.

It is the answer to a much needed piece of information upon which to base further analysis and proposals by the Commission and the Member States.

It contains time series of the basic aggregates of social protection in the European Community.

The data are harmonized in accordance with the **European System and Integrated Social Protection Statistics (ESSPROS)** and include total current expenditure and receipts as well as their breakdown by function in the case of social protection benefits, and by nature and sector of origin in the case of receipts. Other economic and demographic data are also published for comparative analysis.

Concerning the field of observation, the data published up to the present in this bulletin refer to the agencies of each country as a whole and do not include the balance of current transactions. The fact that they are neglected affects the general balance which is also affected by the depreciation and technical insurance reserves which it includes. The balance of transactions is not the ideal basis for a description of capital transactions. However, the description of the latter is not yet possible to obtain from ESSPROS, nor are fiscal benefits.

It should be noted that:

- a) no results for **Greece** are available;
- b) harmonization of the **Portuguese** and **Spanish** data has been completed but Portuguese data are not available in time to be published;
- c) only five countries - **Denmark, Republic Federal of Germany, Ireland, Luxembourg** and the **Netherlands** - have complete time series for the period 1970-1985.
 - **Italian** and **Spanish** series although updated till 1985 started, the former in 1975 and the latter in 1980;
 - data for **France** are two years late;
 - data for **Belgian**, and **United Kingdom** one year late;
- d) amounts related to the last published year as well as some of those concerning the preceding years should be considered as provisional.

We can conclude, therefore, that although this is far from being dramatic, ESSPROS can not yet provide a complete and updated image of the current expenditure and receipts in regard to social protection.

As far as the indicators are concerned, expenditure in per cent of the Gross Domestic Product (GDP) is the most usually applied indicator on social protection expenditure. A shortcoming of this indicator is that it tends to decrease with economic growth while GDP tends to increase. When economic trends go downwards the reverse behaviour is observed.

It is worth noting in table 1 that the Federal Republic of Germany was the country who up to 1977, spent more on current social protection as percentage of GDP. From 1977 onwards this situation changed in favour of the Netherlands.

Current expenditure includes social protection benefits, administration costs and other current expenditure. The benefits are the part of social protection expenditure allocated to the persons protected. Thus they are the most interesting feature in terms of analysis designed to focus on the point of view of the persons protected. In graph 1 it is interesting to notice three groups of countries reflecting the system of social protection and the levels of compensation:

- a) NL, DK, D;
- b) F, L, B
- c) the others.

On the other hand, social protection expenditure is defined in particular by reference to a series of risks or functions constituting, so to speak, the areas within which protection must be arranged for individuals or households (table 3). Contrary to previous publications the main functions have been aggregated to five groups.

Old-aged and survivors together with health are the main functions of social protection benefits (table 4). For all countries except Ireland and Denmark, they represent almost three quarters of the total social protection benefits.

In order to describe and analyse the economic aspects of the financing of social protection expenditure, current receipts are traditionally broken down between social contributions and contributions from general government and other receipts (Table 5). Social contribution are subdivided into main flows, according to whether they are paid by the employer or by the protected person. These flows are further subdivided, the former according to whether they are actual or imputed contribution and the latter according to the socio-occupational status of the contributor. It can be seen that employers' contributions are the main source of contribution to social protection expenditure, except in DK, IRL and UK. Almost 77% of the total budget on social protection in Denmark is paid by public authorities, followed by 65% in Ireland and 43% in the United Kingdom.

Table 7 classifies current receipts by the institutional sector which provides the receipts. They are the enterprises, the different governments, the households and others. The latter include the private non-profit institutions, serving households and the rest of the world.

Receipts for this sector represent more than one third of the social current receipts in all countries for which data are available and in Denmark and Ireland even more than 2/3.
